

Who should get tested for COVID-19?

You should get tested if you have symptoms of COVID-19.

- Fever or chills
- Cough
- Shortness of breath or difficulty breathing
- Fatigue
- Muscle or body aches
- Headache
- New loss of taste or smell
- Sore throat
- Congestion or runny nose
- Nausea or vomiting
- Diarrhea

You should get tested if you have been in close contact with someone who has a confirmed case of COVID-19.

- People should test at least 5 days after you've had contact, even if you don't develop any symptoms.
- People who have tested positive for COVID-19 within the past 3 months and recovered do not need to get tested after an exposure if they do not develop symptoms.

You should get tested if you have taken part in activities that put you at higher risk for COVID-19 because you could not physically distance as needed, including travel, attending large social or mass gatherings, or being in crowded indoor settings.

You should get tested for COVID-19 screenings (schools, workplaces, congregate settings, etc.).

You should get tested if you have been asked or referred to get testing by a health care provider or public health professional.

To learn if you are currently infected with COVID-19, a viral test is used. If you test negative, you were probably not infected at the time your sample was collected. It is important to remember that a negative test does not mean you will not get sick. It means you did not have COVID-19 when your sample was collected, or you may have tested negative if the sample was collected early in your infection, and you may test positive later during your illness. You may also be exposed to COVID-19 after the test and get infected at that time.

*Photo identification (to provide test results) is required.
You will not be asked about your immigration status.*
