</table>
Optimal prehospital care results from a combination of careful patient assessment, essential prehospital emergency medical services, and appropriate medical consultation. The purpose of this manual is to provide guidance for ALL prehospital care providers and emergency department physicians within the Clark County EMS System.

The GOAL of the manual is to STANDARDIZE prehospital patient care in Clark County. It is to be understood that these protocols are guidelines. Nothing contained in these protocols shall be construed to expand the scope of practice of any licensed Attendant beyond that which is identified in the Clark County Emergency Medical Services Regulations and these protocols (Appendix C).

NOTHING contained within these protocols is meant to delay rapid patient transport to a receiving facility. Patient care should be rendered while en-route to a definitive treatment facility.

The General Assessment protocols must be followed in the specific sequence noted. For all other treatment protocols, the algorithm defines the care every patient should receive, usually in the order described.

To maintain the life of a specific patient, it may be necessary, in rare instances, for the physician providing on-line medical consultation, as part of the EMS consultation system, to direct a prehospital provider in rendering care that is not explicitly listed within these protocols, to include administering a patient’s own medications which are not part of the approved formulary. To proceed with such an order, both the telemetry physician and the provider must acknowledge and agree that the patient’s condition and extraordinary care are not addressed elsewhere within these medical protocols, and that the order is in the best interest of patient care. Additionally, the provider must feel capable, based on the instructions given by the telemetry physician, of correctly performing the directed care. Whenever such care is provided, the telemetry physician and the provider must immediately notify the Office of EMS & Trauma System (OEMSTS) of the extraordinary care situation. In addition, the provider must immediately, upon completion of the call, make available the prehospital care record and documentation specifying the nature of the deviation and the ordering physician’s name to the OEMSTS. All such incidents will be entered into the Quality Improvement Review process.

Occasionally a situation may arise in which a physician's order cannot be carried out, e.g., the provider feels the administration of an ordered medication would endanger the patient, a medication is not available, or a physician's order is outside of protocol. If this occurs, the provider must immediately notify the telemetry physician as to the reason the order cannot be carried out, and indicate on the prehospital care record what was ordered, the time, and the reason the order could not be carried out. In addition, the provider must immediately notify the OEMSTS, and upon completion of the call, make available the prehospital care record to the OEMSTS. All such incidents will be entered into the Quality Improvement Review process.
Protocol Key:

- Caution / Warning / Alert
- Pediatric Treatment Consideration (for patients less than 12 years of age)
- Telemetry Contact Required
- Specific Protocol

EMT Licensed Attendant and above may perform these steps
AEMT Licensed Attendant and above may perform these steps
Paramedic Licensed Attendant

Definition of a patient:

A patient is any individual that meets at least one of the following criteria:

1) A person who has a complaint or mechanism suggestive of potential illness or injury;
2) A person who has obvious evidence of illness or injury; or
3) A person identified by an informed 2nd or 3rd party caller as requiring evaluation for potential illness or injury.

Pediatric patient considerations:

For patients <18 years old, use the Pediatric Patient Destination protocol.

Pediatric treatment protocols are to be used on children who have not yet experienced puberty. Signs of puberty include chest or underarm hair on males, and any breast development in females.

These protocols have been developed specifically for the Clark County EMS System and represent consensus among all of the Clark County EMS agency medical directors and the Chief Health Officer. The protocols demonstrate a commitment to a consistent approach to quality patient care.

From time to time, protocols may be added or revised by the Chief Health Officer upon recommendation by the Medical Advisory Board (MAB). Additional recommendations are welcome and appreciated at any time. They may be submitted to the OEMSTS for consideration and referral to the Medical Advisory Board.

Southern Nevada Health District
Office of Emergency Medical Services & Trauma System
P.O. Box 3902
Las Vegas, Nevada 89127

Physical address:
280 S Decatur Blvd
Las Vegas, NV 89152
Office Hours: Mon-Fri 8:00 am to 4:30 pm

Questions may also be telephoned to EMS staff at (702) 759-1050, or visit our website at http://www.southernnevadahealthdistrict.org/ems/index.php.
**Chief Health Officer:** Fermin Leguen, MD, MPH

**EMS Agency Medical Directors who serve on the Medical Advisory Board:**

Dan Rollins, MD, Boulder City Fire Department  
Scott Scherr, MD, Clark County Fire Department and Guardian Elite Medical Services  
Jessica Leduc, DO, Henderson Fire Department  
David Slattery, MD, FACEP, Las Vegas Fire & Rescue  
Jarrod Johnson, DO, Mesquite Fire & Rescue  
Ryan Hodnick, DO, Moapa Valley Fire District  
Alexander Malone, MD, North Las Vegas Fire Department  
Mike Barnum, MD, American Medical Response  
Jeff Davidson, MD, MedicWest Ambulance  
David Obert, DO, Community Ambulance  
Matt Horbal, MD, Mt. Charleston Fire Protection District

**OEMSTS Staff:**

Christian Young, MD, EMS & Trauma System Medical Director [YoungC@snhd.org]  
John Hammond, BS, Paramedic, EMS & Trauma System Manager [Hammond@snhd.org]  
Laura Palmer, BS, Paramedic, EMS & Trauma System Supervisor [PalmerL@snhd.org]  
Chad Kingsley, MD, Regional Trauma Coordinator [Kingsley@snhd.org]  
Candace Toyama, NR Paramedic, EMS Field Representative [Toyama@snhd.org]  
Scott Wagner, BS, NR Paramedic, EMS Field Representative [Wagner@snhd.org]  
Rae Pettie, EMSTS Program/Project Coordinator [Pettie@snhd.org]  
Judy Tabat, EMSTS Program/Project Coordinator [Tabat@snhd.org]  
Michelle Stanton, Senior Administrative Assistant [Stanton@snhd.org]

ADULT TREATMENT PROTOCOLS
General Adult Assessment Protocol

Scene Safety / Scene Size-Up
Nature of Call / Mechanism of Injury
PPE / BSI
Bring all equipment to patient’s side

Level of Consciousness
Airway
Breathing
Circulation
Disability

Unresponsive → Check Pulse

None → Cardiac Arrest

S.T.A.R.T. Triage

Signs of Compromise or Not Protecting

Inadequate or Respiratory Distress

Bleeding

Altered or Confused

Cardiac Arrest

Ventilation Management
Respiratory Distress
General Trauma
Altered Mental Status/Syncope

History – HPI & AMPLE

Vital Signs & Physical Exam

Blood glucose testing as indicated
Specific treatment protocol as indicated
Cervical Stabilization as indicated
Comfort measures (splint, position of comfort)

Cardiac monitor as indicated

Vascular Access as indicated
Oxygen therapy to keep SpO₂ ≥94%
Pain Management as indicated

Radio Contact for all Trauma Center patients, Code 3 returns, need for telemetry physician & as per protocol

Transport to closest facility for:
- Airway emergencies (inability to adequately ventilate)

Transport per Disposition Criteria, if applicable
Pearls

- For all scenes where patient needs exceed available EMS resources, initial assessment and treatment shall be in accordance with an approved triage methodology.
- Correct life-threatening problems as identified.
- If the ability to adequately ventilate a patient cannot be established, the patient must be transported to the nearest emergency department.
- Never withhold oxygen from a patient in respiratory distress.
- Contact with online medical control should be established by radio. Telephone contact may only be used if the call is routed via a recorded phone patch through FAO at 702-382-9007.

Disposition

- Patients sustaining traumatic injuries shall be transported in accordance with the Trauma Field Triage Criteria Protocol.
- Patients sustaining burn injuries shall be transported in accordance with the Burns Protocol.
- Pediatric patients (<18 y/o for transport purposes only) shall be transported in accordance with the Pediatric Destination Protocol.
- Patients with evidence of a stroke shall be transported in accordance with the Stroke (CVA) Protocol.
- Sexual assault victims <13 y/o shall be transported to Sunrise Hospital.
- Sexual assault victims 13 y/o up to 18 y/o shall be transported to Sunrise Hospital or UMC.
- Sexual assault victims 18 y/o and older shall be transported to UMC.
- For sexual assault victims outside a 50-mile radius from the above facilities, the patient shall be transported to the nearest appropriate facility.
- Stable patients shall be transported to the hospital of their choice, if the patient has no preference the patient should be transported to the closest facility.
- For patients outside a 50 mile radius from protocol designated transport destinations, the licensee providing emergency medical care shall transport the patient to the nearest appropriate facility.

Waiting Room Criteria

Upon arrival in the emergency department, if transfer of care has not occurred in accordance with NRS 450B.790, any patient, excluding patients placed on a legal psychiatric hold, meeting ALL the following criteria may be placed in the hospital waiting room or other appropriate location:

1. Normal vital signs
   A. Heart rate 60 - 100
   B. Respiratory rate 10 - 20
   C. Systolic BP 100 - 180
   D. Diastolic BP 60 - 110
   E. Room air pulse oximetry >94%
   F. Alert and oriented x 4

2. Did not receive any parenteral medications during EMS transport except a single dose of analgesia and/or an anti-emetic.

3. In the judgment of the Paramedic, does not require continuous cardiac monitoring. Note: Any ECG monitoring initiated by a transferring facility may not be discontinued by EMS personnel.

4. Can maintain a sitting position without adverse impact on their medical condition.

5. Is left with a verbal report to hospital personnel.

Internal Disaster

- If a hospital declares an internal disaster, that facility is to be bypassed for all patients except patients in cardiac arrest or in whom the ability to adequately ventilate has not been established.
- Operational exceptions may be initiated in regard to transport to hospitals on internal disaster.
General Adult Trauma Assessment Protocol (revised and MAB approved 4-7-2021)
### History
- Time and mechanism of injury
- Damage to structure or vehicle
- Location in structure or vehicle
- Others injured or dead
- Speed and details of MVC
- Restraints/protective equipment
- Past medical history
- Medications

### Signs and Symptoms
- Pain, Swelling
- Deformity, lesions, bleeding
- AMS or unconscious
- Hypotension or shock
- Arrest

### Differential (life threatening)
- Tension pneumothorax
- Flail chest
- Pericardial tamponade
- Open chest wound
- Hemothorax
- Intra-abdominal bleeding
- Pelvis/femur fracture
- Spine fracture/cord injury
- Head injury
- Extremity fracture
- HEENT (airway obstruction)
- Hypothermia

### Pearls
- Recommended exam: Mental Status, Skin, HEENT, Heart, Lung, Abdomen, Extremities, Back, Neuro.
- Transport destination is based on the Trauma Field Triage Criteria Protocol.
- Transport should not be delayed for procedures; ideally procedures should be performed enroute when possible.
- BVM is an acceptable method of ventilating and managing an airway if pulse oximetry can be maintained \( \geq 90\% \).
- Geriatric patients should be evaluated with a high index of suspicion; occult injuries may be present and geriatric patients can decompensate quickly.
Abdominal / Flank Pain, Nausea & Vomiting

General Adult Assessment

12-Lead ECG if age >35 yrs

Signs of hypovolemia?

Yes

Vascular Access
500 ml NS or LR bolus; may repeat up to 2000 ml

No

Nausea or vomiting?

Yes

Consider an Anti-emetic:
ONDANSETRON 4 mg ODT/IM/IV/IO
or DROPERIDOL 1.25 mg IM/IV/IO
or METOCLOPRAMIDE 10 mg slow IV bolus over 1-2 minutes or IM
or PROCHLORPERAZINE Up to 10 mg IV/IM/IO

No

Consider Chest Pain (Non Traumatic) and Suspected Acute Coronary Syndrome

Yes

Consider Pain Management

No

Continue General Adult Assessment

**Pearls**
- **Recommended Exam:** Mental Status, Skin, HEENT, Heart, Lung, Abdomen, Back, Extremities, Neuro.
- **Neuro disorders or signs of hypoperfusion/shock in the presence of abdominal pain may indicate an aneurysm.**
- **Document mental status and vital signs prior to administration of anti-emetics & pain management.**
- **Repeat vital signs after each fluid bolus**
- **In patients ≥35 years old consider cardiac origin. Perform a 12-Lead ECG.**
- **Consider retroperitoneal palpation for kidney pain.**
- **Abdominal pain in women of childbearing age should be considered pregnancy until proven otherwise.**
Allergic Reaction Protocol

1. **General Adult Assessment**

2. **Evidence of airway involvement/breathing difficulties?**
   - **Yes**
     - **EPINEPHRINE**
       - Assist patient with own auto-injector
       - EPINEPHRINE 1:1000, 0.5 mg IM; may repeat q 15 min up to max 1.5 mg
     - **Ventilation Management**
       - ALBUTEROL 2.5 mg SVN; repeat as needed
     - **Cardiac monitor**
       - IV access 500 cc NS or LR bolus; may repeat up to 2L
   - **No**
     - **ALBUTEROL**
       - Assist patient with MDI
       - 2.5 mg SVN; repeat as needed
     - **Ventilation Management**
       - Cardiac monitor
       - IV access 500 cc NS or LR bolus; may repeat up to 2L
     - **DIPHENHYDRAMINE**
       - 50 mg IM/IV/IO/PO

3. **Patient in shock?**
   - **Yes**
     - **Cardiac monitor**
     - IV access 500 cc NS or LR bolus; may repeat up to 2L
   - **No**
     - **DIPHENHYDRAMINE**
       - 50 mg IM/IV/IO/PO

4. **Vascular Access**
   - **DIPHENHYDRAMINE**
     - 50 mg IM/IV/IO/PO

5. **Reassess patient q 5 min**

6. **Notify Receiving Hospital**

**Evidence of airway involvement/breathing difficulties?**

- **Yes**
  - **EPINEPHRINE**
    - Assist patient with own auto-injector
    - EPINEPHRINE 1:1000, 0.5 mg IM; may repeat q 15 min up to max 1.5 mg
  - **Ventilation Management**
    - ALBUTEROL 2.5 mg SVN; repeat as needed
  - **Cardiac monitor**
    - IV access 500 cc NS or LR bolus; may repeat up to 2L
- **No**
  - **ALBUTEROL**
    - Assist patient with MDI
    - 2.5 mg SVN; repeat as needed
  - **Ventilation Management**
    - Cardiac monitor
    - IV access 500 cc NS or LR bolus; may repeat up to 2L
  - **DIPHENHYDRAMINE**
    - 50 mg IM/IV/IO/PO

**Cardiac monitor**

- IV access 500 cc NS or LR bolus; may repeat up to 2L
- **DIPHENHYDRAMINE**
  - 50 mg IM/IV/IO/PO

**Notify Receiving Hospital**

**Evidence of airway involvement/breathing difficulties?**

- **Yes**
  - **EPINEPHRINE**
    - Assist patient with own auto-injector
    - EPINEPHRINE 1:1000, 0.5 mg IM; may repeat q 15 min up to max 1.5 mg
  - **Ventilation Management**
    - ALBUTEROL 2.5 mg SVN; repeat as needed
  - **Cardiac monitor**
    - IV access 500 cc NS or LR bolus; may repeat up to 2L
  - **DIPHENHYDRAMINE**
    - 50 mg IM/IV/IO/PO
- **No**
  - **ALBUTEROL**
    - Assist patient with MDI
    - 2.5 mg SVN; repeat as needed
  - **Ventilation Management**
    - Cardiac monitor
    - IV access 500 cc NS or LR bolus; may repeat up to 2L
  - **DIPHENHYDRAMINE**
    - 50 mg IM/IV/IO/PO

**Cardiac monitor**

- IV access 500 cc NS or LR bolus; may repeat up to 2L
- **DIPHENHYDRAMINE**
  - 50 mg IM/IV/IO/PO

**Notify Receiving Hospital**

**Evidence of airway involvement/breathing difficulties?**

- **Yes**
  - **EPINEPHRINE**
    - Assist patient with own auto-injector
    - EPINEPHRINE 1:1000, 0.5 mg IM; may repeat q 15 min up to max 1.5 mg
  - **Ventilation Management**
    - ALBUTEROL 2.5 mg SVN; repeat as needed
  - **Cardiac monitor**
    - IV access 500 cc NS or LR bolus; may repeat up to 2L

**Notify Receiving Hospital**
History
- Onset and location
- Insect sting or bite
- Food allergy/exposure
- Medication allergy/exposure
- New clothing, soap, detergent
- Past history of reactions
- Past medical history
- Medication history

Signs and Symptoms
- Itching or hives
- Coughing/wheezeing or respiratory distress
- Throat or chest constriction
- Difficulty swallowing
- Hypotension/shock
- Edema
- Nausea/vomiting

Differential
- Urticarial (rash only)
- Anaphylaxis (systemic effect)
- Shock (vascular effect)
- Angioedema (drug induced)
- Aspiration/airway obstruction
- Asthma/COPD
- CHF

Pearls
- Recommended Exam: Mental Status, Skin, Heart, Lung.
- Anaphylaxis is an acute and potentially lethal multisystem allergic reaction.
- Epinephrine is a first-line drug that should be administered in acute anaphylaxis (moderate/severe symptoms). IM Epinephrine (1:1,000) should be administered in priority before or during attempts at IV or IO access.
- Contact Medical Control for refractory anaphylaxis.
- Consider ETCO₂ monitoring.

Severity
- Mild reactions involve skin rashes, itchy sensation, or hives with no respiratory involvement.
- Moderate reactions involve skin disorders and may include some respiratory involvement like wheezing, yet the patient still maintains good tidal volume air exchange.
- Severe reactions involve skin disorders, respiratory difficulty, and may include hypotension.

Special Considerations
- Always perform ECG monitoring when administering Epinephrine.
- Consider Dopamine for hypotension refractory to administration of Epinephrine.
- Provide oxygen and airway support as needed.

QI Metrics:
- Epinephrine given appropriately.
- Airway assessment documented.
Altered Mental Status / Syncope

**General Adult Assessment**

- **BG <60 mg/dl**
  - **E** Blood glucose testing
  - **A** Vascular Access
    - ORAL GLUCOSE if patient protecting airway
      - D10, 25 g IV/IO; (250 mL of 10% solution) may repeat x 1 in 5 min
      - GLUCAGON 1.0 mg IM for no IV access
        - Improved mental status?
          - Yes
            - Other treatment protocols as indicated
          - No
        - Consider the following:
          - Signs of stroke?
          - Signs of hypoperfusion?
          - Signs of a seizure of post-ictal state?
          - Signs of trauma or head injury?
          - Cardiac causes/known disease?
          - Unresponsive with respiratory depression & suspected narcotic overdose

- **BG >60 mg/dl**
  - Cardiac monitor
  - 12-Lead ECG
  - Consider NS or LR 500 ml IV may repeat up to 2000 ml

**Other treatment protocols as indicated**
History
- Known diabetic, Medic Alert tag
- Drugs or drug paraphernalia
- Report of drug use or toxic ingestion
- Past medical history
- Medications
- History of trauma
- Change in condition
- Changes in feeding or sleep habits

Signs and Symptoms
- Decreased mental status or lethargy
- Changes in baseline mental status
- Bizarre behavior
- Hypoglycemia
- Hyperglycemia
- Irritability

Differential
- Head trauma
- CNS (stroke, tumor, seizure, infection)
- Cardiac (MI, CHF)
- Hypothermia
- Infection
- Thyroid
- Shock (septic, metabolic, traumatic)
- Diabetes
- Toxicological or ingestion
- Acidosis/Alkalosis
- Environmental exposure
- Hypoxia
- Electrolyte abnormality
- Psychiatric disorder

Pearls
- Recommended Exam: Mental Status, HEENT, Skin, Heart, Lung, Abdomen, Back Extremities, Neuro.
- Pay careful attention to the head exam for signs of injury.
- Be aware of AMS as presenting sign of an environmental toxin or Haz-Mat exposure, and protect personal safety and that of other responders.
- Do not let alcohol confuse the clinical picture; alcohol is not commonly a cause of total unresponsiveness to pain.
- If narcotic overdose or hypoglycemia is suspected, administer Narcan or Glucose prior to advanced airway procedures.
Behavioral Emergency

Scene Safety

General Adult Assessment

Consider medical causes for the patient’s behavior:
1. Hypoxia
2. Intoxication / Overdose
3. Hypoglycemia / Electrolytes
4. Head Injury
5. Post-ictal State

Suspect Excited Delirium?

Yes

Consider behavioral restraints;
No prone position
Consider Law Enforcement escort

MIDAZOLAM
0.1 mg/kg IN/IM/IV/IO up to a max of 5 mg
may repeat at 0.05 mg/kg
OR
DIAZEPAM
5 mg IV/IO; may repeat q 5 min
OR
DROPERIDOL
1.25 mg IM/IV/IO followed by a saline flush or bolus;
may repeat dose q 5 min

Transport

No

Implement the S.A.F.E.R. model

Yes

Threatened to harm SELF

Consider behavioral restraints;
No prone position
Consider Law Enforcement escort
Consider a flight risk

Transport

No

Suspected Excited Delirium?

Yes

P

KETAMINE
2 mg/kg IV/IO OR 2-4 mg/kg IM

Consider behavioral restraints;
No prone position
Consider Law Enforcement escort

Transport

Consider behavioral restraints;
No prone position
Consider Law Enforcement escort

Threatened to harm OTHERS

4-point restraints; hood
if indicated; NO PRONE POSITION

Persistent risk

Transport

No

Threatened or acted in a way that suggests threat to self or others?

Yes

No

Suspect Excited Delirium?

Yes

No

No

No

Persistent risk

Excited Delirium Syndrome

Medical emergency-combination of delirium, psychomotor agitation, anxiety, hallucinations, speech disturbances, disorientation, violent behavior, insensitivity to pain, hyperthermia, and increased strength.

Potentially life threatening, and associated with the use of physical control measures including restraints, TASER, or similar device.

Most common in male subjects with a history of serious mental illness and/or acute or chronic drug abuse, particularly stimulants.
**History**
- Situational crisis
- Psychiatric illness/medications
- Injury to self or threats to others
- Medic Alert tag
- Substance abuse/overdose
- Diabetes

**Signs and Symptoms**
- Anxiety, agitation, confusion
- Affect change, hallucinations
- Delusional thoughts, bizarre behavior
- Combative, violent
- Expression of suicidal/homicidal thoughts

**Differential**
- AMS differential
- Alcohol intoxication
- Toxin/substance abuse
- Medication effect or overdose
- Withdrawal syndromes
- Depression
- Bipolar
- Schizophrenia
- Anxiety disorder

**Pearls**
- Law enforcement assistance should be requested on all calls involving potentially violent patients.
- Under no circumstances are patients to be transported restrained in the prone position.
- Recommended Exam: Mental Status, Skin, Heart, Lung, Neuro.
- Consider all possible medical/trauma causes for behavior.
- Do not irritate the patient with a prolonged exam.
- EMS providers are mandatory reporters in regard to suspected abuse of any vulnerable person.
- Consider ETCO$_2$ monitoring.

**Excited Delirium Syndrome**
- Medical emergency-combination of delirium, psychomotor agitation, anxiety, hallucinations, speech disturbances, disorientation, violent behavior, insensitivity to pain, hyperthermia, and increased strength.
- Potentially life threatening, and associated with the use of physical control measures including restraints, TASER, or similar device.
- Most common in male subjects with a history of serious mental illness and/or acute or chronic drug abuse, particularly stimulants.

**Dystonic Reaction**
- Condition causing involuntary muscle movements or spasms typically of the face, neck and upper extremities.
- Typically an adverse reaction to drugs such as Haloperidol (may occur with administration).
- When recognized, administer Diphenhydramine 50 mg IM/IV/IO.

**S.A.F.E.R.**
- Stabilize the situation by containing and lowering the stimuli.
- Assess and acknowledge the crisis.
- Facilitate the identification and activation of resources (chaplain, family, friends or police).
- Encourage patient to use resources and take actions in his/her best interest.
- Recovery or referral – leave patient in care of responsible person or professional, or transport to appropriate facility.
Bradycardia

General Adult Assessment

Vascular Access

Cardiac monitor/12-Lead ECG

ECG shows STEMI

Acute Coronary Syndrome (Suspected)

HR <50 bpm & ANY of the following:
1. Hypoperfusion
2. Altered mental status
3. Signs of shock

No

Observe Transport

Responsive to Atropine

Repeat 12-Lead ECG

Yes

ATROPINE
0.5 mg IVP/IO; may repeat q 3-5 min; max dose 3 mg

Refractory

Transcutaneous Pacing

Failure to capture

PUSH DOSE PHENYLEPHRINE
100 mcg – 200 mcg IV/IO, may repeat q 2-5 min to maintain SBP >90 (1ml – 2 ml of a 100 mcg/ml solution)

Consider:
DOPAMINE
5-10 mcg/kg/min IV/IO; titrate to SBP >90, max dose 20 mcg/kg/min

Consider:
GLUCAGON
1 mg IV/IO for patients on beta blockers
CALCIUM CHLORIDE
1 g IV/IO for patients on calcium channel blockers

Notify Receiving Hospital

Signs of hypotension, AMS, shock

Consider Transcutaneous Pacing

Consider:
ATROPINE
0.5 mg IVP/IO; may repeat q 3-5 min; max dose 3 mg
## History
- Past medical history
- Medications
- Pacemaker

## Signs and Symptoms
- HR <60/min with hypotension, acute AMS, chest pain, acute CHF, seizures, syncope, or shock secondary to bradycardia
- Respiratory distress

## Differential
- Acute myocardial infarction
- Hypoxia
- Pacemaker failure
- Hypothermia
- Sinus bradycardia
- Athletic
- Head injury (elevated ICP) or stroke
- Spinal cord lesion
- AV block
- Overdose

## Pearls
- Recommended Exam: Mental Status, HEENT, Heart, Lung, Neuro.
- Bradycardia causing symptoms is typically <50/minute. Rhythm should be interpreted in the context of symptoms and pharmacological treatment given only when symptomatic, otherwise monitor and reassess.
- Identifying signs and symptoms of poor perfusion caused by bradycardia are paramount.
- Do not delay pacing while waiting for IV access.
- Hypoxemia is a common cause of bradycardia; be sure to oxygenate the patient and provide ventilatory support as needed.

## QI Metrics
- High degree blocks correctly identified.
- Pacer pads on patient if Atropine given.
- Patient paced if appropriate.
Burns

General Adult Assessment

Thermal Exposure

Stop the burning process with water or saline
Remove smoldering clothing and jewelry
Do not remove STUCK clothing

Ventilation Management

Cover burned area with dry sterile dressing
DO NOT USE any ice, lotion, ointment or antiseptic!

Vascular Access

IVF – NS or LR 500 ml fluid bolus if signs of hypoperfusion, OR >20% BSA burn present;
Contact Medical Direction at Burn Center for further drip rates or additional boluses

Cardiac monitor

Pain Management

Consider Smoke Inhalation

Chemical / Electrical Exposure

Eye Involvement?
Continuous saline flush in affected eyes. Flush with water or NS for 10-15 min
Remove jewelry, constricting items, and expose burned area
Identify entry and exit sites, apply sterile dressings

Vascular Access

IVF – NS or LR 500 ml fluid bolus if signs of hypoperfusion, OR >20% BSA burn present;
Contact Medical Direction at Burn Center for further drip rates or additional boluses

Cardiac monitor

Pain Management

Transport to closest appropriate Burn Care Center:
Sunrise Hospital
UMC Trauma Center
History
- Type of exposure (heat, gas, chemical)
- Inhalational injury
- Time of injury
- Past medical history & medications
- Other trauma
- Loss of consciousness
- Tetanus/immunization status

Signs and Symptoms
- Burns, pain, swelling
- Dizziness
- Loss of consciousness
- Hypotension/shock
- Airway compromise/distress
- Wheezing
- Singed facial or nasal hair
- Hoarseness or voice changes

Differential
- Superficial (1st degree) – red and painful
- Partial Thickness (2nd degree) – blistering
- Full Thickness (3rd degree) – painless/charred or leathery skin
- Thermal
- Chemical
- Electrical
- Radiation
- Lightning

Pearls
- Burn patients are trauma patients; evaluate for multisystem trauma.
- Assure whatever has caused the burn, is no longer contacting the injury. (Stop the burning process!)
- Recommended Exam: Mental Status, HEENT, Neck, Heart, Lungs, Abdomen, Extremities, Back, Neuro.
- Consider early intubation with patients experiencing significant inhalation injuries.
- Potential CO exposure should be treated with 100% oxygen. (For patients in which the primary event is CO inhalation, transport to a hospital equipped with a hyperbaric chamber is indicated [when reasonably accessible].)
- Circumferential burns to extremities are dangerous due to potential vascular compromise secondary to soft tissue swelling. Elevate extremity.
- Burn patients are prone to hypothermia - never apply ice or cool burns; must maintain normal body temperature.
- Consider ETCO₂ monitoring.

Early Intubation Indications
- Signs of Airway Obstruction
- Hoarseness, Stridor, Dyphagia
- Extensive Deep Facial Burns
- Signs of Respiratory Compromise
  - Accessory Muscle Use
  - Inability to Clear Secretions
  - Poor Oxygenation
- Burns in Mouth
- Total BSA ≥ 40%
- Altered Mentation
- Significant Risk of Edema

Patients meeting the following Criteria shall be transported to the closest appropriate Burn Care Center:
1. Second degree burns >10% body surface area (BSA).
2. Any Third degree burns.
3. Burns that involve the face, hands, feet, genitalia, perineum, or major joints.
4. Electrical burns including lightning injury.
5. Chemical burns.
6. Circumferential burns.
7. Inhalation burns.
8. Burn injury with concomitant trauma

Fluid Resuscitation
- Adults 13 years and above 500 ml NS or LR bolus
- Contact Burn Center Medical Direction for additional boluses or drip rates or if it is a prolonged transport.

Pearls (Electrical)
- Do not contact the patient until you are certain the source of the electric shock has been disconnected.
- Attempt to locate contact points, (entry wound where the AC source contacted the patient; an exit at the ground point); both sites will generally be full thickness.
- Cardiac monitor; anticipate ventricular or atrial irregularity to include V-Tach, V-Fib, heart blocks, etc.
- Attempt to identify the nature of the electrical source (AC vs DC), the amount of voltage and the amperage the patient may have been exposed to during the electrical shock.

Pearls (Chemical)
- Certainly 0.9% NaCl Sol’n or Sterile Water is preferred; however if it is not readily available, do not delay; use tap water for flushing the affected area or other immediate water sources. Flush the area as soon as possible with the cleanest, readily available water or saline solution using copious amounts of fluids.

Burns (Revised and MAB approved 4-7-2021)
Cardiac Arrest (Non-Traumatic) Approved by MAB 06-23-2021

General Adult Assessment

Meets criteria for Prehospital Death Determination or DNR/POLST present?

If witnessed by EMS or CPR in progress and patient is unresponsive with no pulse, begin chest compressions at a rate of 30:2 until an advanced airway is successfully placed.

E Apply AED and defibrillate, if prompted
E Insert NPA or OPA and begin BVM at 8 BPM
P Apply cardiac monitor

Rhythm shockable?

Yes

VF/VT
P Defibrillate

E Continue CPR for 2 min
A Vascular Access

Rhythm shockable?

Yes

E Defibrillate if prompted (AED)
P Defibrillate
E Continue CPR for 2 min
P EPINEPHRINE 1 mg IV/IO q 3-5 min; ETT Administration requires 2 to 2.5 times the dose
A Consider Extraglottic Airway Device
A Consider Endotracheal Intubation

Rhythm shockable?

No

No

No

Rhythm shockable?

Yes

Use Asystole/PEA side as indicated
Check pulse, if organized rhythm
If patient remains unresponsive to resuscitation efforts, consider Termination of Resuscitation Protocol

No

No

Rhythm shockable?

Yes

Use VF/VT side as indicated

E Continue CPR for 2 min
A EPINEPHRINE 1 mg IV/IO q 3-5 min; ETT Administration requires 2 to 2.5 times the dose
A Consider Extraglottic Airway Device
A Consider Endotracheal Intubation

P Asystole/PEA
E Continue CPR for 2 min
A Vascular Access
P EPINEPHRINE 1 mg IV/IO q 3-5 min; ETT Administration requires 2 to 2.5 times the dose
A Consider Extraglottic Airway Device
A Consider Endotracheal Intubation

P

IF HYPOXIA IS THE CAUSE OF THE ARREST, EARLY VENTILATION IS RECOMMENDED

AT ANY TIME Return of Spontaneous Circulation, go to Target Temperature Management & Post-Resuscitation Protocol

Cardiac Arrest (Non-Traumatic)

Referee to Termination of Resuscitation or DNR/POLST Protocol as appropriate

No

Yes

Refer to Termination of Resuscitation or DNR/POLST Protocol as appropriate
History
- Events leading to arrest
- Estimated down time
- Past medical history
- Medications
- Existence of terminal illness

Signs and Symptoms
- Unresponsive
- Apneic
- Pulseless

Differential
- Medical vs. Trauma
- VF vs. Pulseless VT
- Asystole
- PEA
- Primary cardiac event vs. respiratory or drug overdose

Pearls
- For cardiac arrest patients who are pregnant, manual CPR is recommended.
- For cardiac arrest patients who are pregnant, manual displacement of the uterus to the left side is recommended.
- Efforts should be directed at high quality and continuous compressions with limited interruptions and early defibrillation when indicated.
- Consider early IO placement if IV is difficult.
- DO NOT HYPERVENTILATE.
- Reassess and document ETT placement using auscultation and ETCO\(_2\) capnography.
- Switch compressors every two minutes.
- Try to maintain patient modesty.
- Mechanical chest compression devices should be used if available in order to provide for consistent uninterrupted chest compressions and crew safety. As noted above, mechanical chest compression devices are not recommended for the pregnant patient.

H’s & T’s (reversible causes)
- Hypovolemia – Volume infusion
- Hypoxia – Oxygenation & ventilation, CPR
- Hydrogen ion (acidosis) – Ventilation, CPR
- Hypokalemia
- Hyperkalemia -Calcium chloride, sodium bicarbonate, albuterol
- Hypothermia - Warming
- Tension pneumothorax – Needle decompression
- Tamponade, cardiac – Volume infusion
- Toxins – Agent specific antidote
- Thrombosis, pulmonary – Volume infusion
- Thrombosis, coronary – Emergent PCI
Chest Pain (Non Traumatic) and Suspected Acute Coronary Syndrome

General Adult Assessment

12-Lead ECG within 5 minutes of patient contact

Non-Diagnostic 12-Lead ECG

A Vascular Access

E Oxygen
Keep SPO2 >94%

E ASPIRIN
324 mg PO

NITROGLYCERIN

E Assist pt with own NTG as prescribed; may repeat X2

P 0.4 mg SL;
May repeat q 5min X2

P Pain Management for continued pain

Consider anti-emetic for nausea/vomiting:
ONDANSETRON
4 mg ODT/IM/IV/IO
or
METOCLOPRAMIDE
10 mg slow IV bolus over 1-2 minutes or IM
or
PROCHLORPERAZINE
Up to 10 mg IV/IM/IO

Transport to hospital of patient’s choice

STEMI

Refer to STEMI (Suspected)

Nitroglycerin is contraindicated in any patient with hypotension, bradycardia, tachycardia (HR>100 bpm) in the absence of heart failure, evidence of a right ventricular infarction, and use of erectile dysfunction medications within the last 48 hours. Caution is advised in patients with Inferior Wall STEMI and a right-sided ECG should be performed to evaluate RV infarction.

Refer to Arrhythmia and Shock Protocols as needed
Chest Pain (Non Traumatic) and Suspected Acute Coronary Syndrome (Revised and approved by MAB 5-1-2019)

History
- Age
- Medications: Viagra, Levitra, Cialis
- Past medical history of MI, angina, diabetes
- Allergies
- Recent physical exertion
- Palliation, provocation
- Quality
- Region, radiation, referred
- Severity (1-10)
- Time of onset, duration, repetition

Signs and Symptoms
- CP, pressure, ache, vise-like pain, tight
- Location, substernal, epigastric, arm, jaw, neck, shoulder
- Radiation of pain
- Pale, diaphoresis
- Shortness of breath
- Nausea, vomiting, dizziness
- Time of onset

Differential
- Trauma versus medical
- Anginal versus MI
- Pericarditis
- Pulmonary embolism
- Asthma, COPD
- Pneumothorax
- Aortic dissection or aneurysm
- GE reflux or hiatal hernia
- Esophageal spasm
- Chest injury or pain
- Pleural pain
- Drug overdose (cocaine, methamphetamine)

Pearls
- Recommended exam: Mental Status, Skin, HEENT, Heart, Lungs, Abdomen, Back, Extremities, Neuro.
- Diabetics, geriatrics, and female patients often have atypical pain. Have a high index of suspicion.
- Perform a 12-Lead ECG on all patients 35 years old or older experiencing vague jaw/chest/abdominal discomfort.
- Perform a 12-Lead ECG within 5 minutes of patient contact.
- The administration of nitroglycerin is contraindicated for any patient who has used erectile dysfunction medications within the last 48 hours.
- Nitroglycerin is contraindicated in any patient with hypotension, bradycardia, or tachycardia in the absence of heart failure and evidence of a right ventricular infarction.

QI Metrics
- 12-Lead ECG within 5 minutes of patient contact.
- Pain reassessed after every intervention.
- Pain control documented.
Childbirth / Labor Protocol (revised and MAB approved 4-7-2021)

**General Adult Assessment**

**Pregnant patient with signs of impending delivery** (see pearls)

- **Normal Presentation**
  - **Puncture amniotic sac if not already broken**
  - **Deliver and support the head**
  - **Suction mouth, then nose; if meconium present, repeat several times**
  - **Deliver upper shoulder, then lower shoulder**
  - **Deliver remainder of the baby**
  - **Clamp and cut umbilical cord**
  - **If multiple births, repeat steps**
  - **Deliver placenta**
  - **Attempt Vascular Access**

- **Limb Presentation**
  - **Place patient in left lateral recumbent position**
  - **Attempt Vascular Access**

- **Breech Presentation**
  - **Support body of baby during delivery of head**
  - **Attempt Vascular Access**

- **Cord Presentation**
  - **Position patient in Trendelenburg and slightly on left side**
  - **Wrap cord and keep it moist**
  - **Insert gloved hand to lift baby off cord; obtain and document cord pulse**
  - **Attempt Vascular Access**

**Patient hypoperfusing?**

- **Yes**
  - **Administer 500 ml NS or LR; repeat as needed not to exceed 2,000 ml**
  - **Transport to Appropriate Facility**

- **No**
  - **Continue General Patient Care**
**History**
- Due date
- Time contractions started/duration/frequency
- Rupture of membranes (meconium)
- Time and amount of any vaginal bleeding
- Sensation of fetal movement
- Pre-natal care
- Past medical and delivery history
- Medications
- Gravida/Para status
- High risk pregnancy

**Signs and Symptoms**
- Spasmodic pain
- Vaginal discharge or bleeding
- Crowning or urge to push
- Meconium

**Differential**
- Abnormal presentation (breech, limb)
- Prolapsed cord
- Placenta previa
- Abruptio placenta

**Pearls**
- Recommended exam (of mother): Mental Status, Heart, Lungs, Abdomen, Neuro.
- Document all times (delivery, contraction duration and frequency).
- Some bleeding is normal; copious amounts of blood or free bleeding is abnormal.
- Record APGAR at one and five minutes after birth.
- APGAR of 7-10 is normal, while 4-7 requires resuscitative measures.

**APGAR**

Cold-Related Illness

General Adult Assessment

- Remove from environment
- Temperature measurement (if available)
- Remove wet clothing
- Dry/warm patient
- Passive warming measures

Hypothermia/Frost Bite

- Awake with/without altered mental status

Respiratory distress?

Yes → Respiratory Distress

No → Active warming measures

Vascular Access

Cardiac monitor

NS or LR bolus 500 ml IV/IO; repeat to effect SBP >90; maximum 2 L

General Adult Trauma Assessment

Shock (Non-Trauma)

Monitor and reassess

Continue General Patient Care and Transport

Monitor and reassess

General wound care

DO NOT rub skin to warm

DO NOT allow refreezing

Systemic Hypothermia

Unresponsive

Pulse present?

Yes → Cardiac Arrest

No → Monitor and reassess

General Adult Trauma Assessment

Shock (Non-Trauma)

Monitor and reassess

Continue General Patient Care and Transport
### History
- Age, very young and old
- Exposure to decreased temperatures, but may occur in normal temperatures
- Past medical history/medications
- Drug or alcohol use
- Infections/sepsis
- Time of exposure/wetness/wind chill

### Signs and Symptoms
- AMS/coma
- Cold, clammy
- Shivering
- Extremity pain
- Bradycardia
- Hypotension or shock

### Differential
- Sepsis
- Environmental exposure
- Hypoglycemia
- Stroke
- Head injury
- Spinal cord injury

### Pearls
- Recommended exam: Mental Status, Heart, Lung, Abdomen, Extremities, Neuro.
- Extremes of age are more prone to cold emergencies.
- Obtain and document patient temperature.
- If temperature is unknown, treat the patient based on suspected temperature.
- Active warming includes hot packs that can be used on the armpit and groin; care should be taken not to place the packs directly on the skin.
- Warm saline or lactated ringers IV may be used.
- Recognize the cardiac arrest resuscitation guidelines for the hypothermic patient.

### Hypothermia Categories
- Mild 90°- 95° F (33°- 35° C)
- Moderate 82°- 90° F (28°- 32° C)
- Severe <82 degrees F (<28° C)

### Hypothermia Mechanisms
- Radiation
- Convection
- Conduction
- Evaporation
General Adult Assessment

Airway protected & ventilation adequate?

- Yes
  - Consider Cervical Stabilization
    - Oxygen 15 L NRB
    - SpO2
    - Capnography
    - ALBUTEROL 2.5 mg in 3 ml SVN; repeat until improvement
    - Consider CPAP
    - Consider 12-Lead ECG
    - Continue General Adult Assessment

- No
  - Ventilation Management
  - Consider Cervical Stabilization

CAVEATS:
1. Adequate ventilation is KEY!!!
2. For patients breathing on their own, start Oxygen 15 L NRB; for patients not adequately breathing → BVM
3. Do not suction foam in airway, just bag through it initially.
4. For drowning victims in cardiac arrest, emphasis should be on good oxygenation/ventilation → use traditional 30:2 CPR (no continuous compressions).
<table>
<thead>
<tr>
<th>History</th>
<th>Signs and Symptoms</th>
<th>Differential</th>
</tr>
</thead>
<tbody>
<tr>
<td>Submersion in fluid, regardless of depth</td>

</tr>
</tbody>
</table>

**Signs and Symptoms**
- Unresponsive
- Mental status changes
- Decreased or absent vital signs
- Vomiting
- Coughing, wheezing, rales, stridor, rhonchi
- Apnea
- Frothy/foamy sputum

**Differential**
- Trauma
- Pre-existing medical condition
- Barotrauma
- Decompression illness
- Post-immersion syndrome

**Pearls**
- Ensure scene safety.
- Hypothermia is often associated with submersion incidents.
- All patients should be transported for evaluation because of potential for worsening over the next several hours.

**QI Metrics**
- Submit the SNHD Submersion Incident Report Form.
Epistaxis

Active bleeding from the nose?

Yes: Compress nose with direct pressure. Tilt head forward. Position of comfort.

No: Significant or Multi-System Trauma?

Yes: General Adult Trauma Assessment

No: Bleeding Controlled?

Yes: General Adult Trauma Assessment

No: Have Patient Blow Nose. Suction Active Bleeding.

OXYMETAZOLINE or PHENYLEPHRINE 2 Sprays to each nostril. Followed by direct pressure.

General Adult Assessment

Active bleeding in posterior oropharynx?

Yes: Bleeding Controlled?

Yes: General Adult Trauma Assessment

No: Have Patient Blow Nose. Suction Active Bleeding.

OXYMETAZOLINE or PHENYLEPHRINE 2 Sprays to each nostril. Followed by direct pressure.

General Adult Assessment

No: General Adult Assessment
Epistaxis

History
- Age
- Past Medical History
- Medications (HTN, Anticoagulants, aspirin, NSAIDS)
- Previous episodes of epistaxis
- Trauma
- Duration of bleeding
- Quantity of bleeding

Signs and Symptoms
- Bleeding from nasal passages
- Pain
- Nausea
- Vomiting

Differential
- Trauma
- Infection (viral URI or Sinusitis)
- Allergic rhinitis
- Lesions (polyps, ulcers)
- Hypertension

Pearls
- Recommended exam: Mental Status, HEENT, Lungs, Neuro
- It is very difficult to quantify the amount of blood loss with epistaxis
- Bleeding may be also occurring posteriorly. Evaluate for posterior blood loss by examining the posterior pharynx.
- Anticoagulants include warfarin (Coumadin), heparin, enoxaparin (Lovenox), dabigatran (Pradaxa), rivaroxaban (Xarelto), and many other over the counter headache relief powders.
- Anti-platelet agents like aspirin, clopidogrel (Plavix), aspirin/dipryridamole (Aggrenox), and ticlopidine (Ticid) can contribute to bleeding.
Heat-Related Illness

General Adult Assessment

Remove from environment
Temperature measurement (if available)
Remove tight clothing
Passive cooling measures

Symptom Severity

Heat Cramps
Normal to elevated body temp, weakness, muscle cramping

PO fluids as tolerated
Monitor and reassess

Heat Exhaustion
Elevated body temp, cool, moist skin weakness, anxious tachypnea

Active cooling measures
Vascular Access
NS or LR bolus 500 ml IV/IO; repeat to effect SBP >90; max 2 L
Cardiac monitor

Poor perfusion?
Yes
Exit to appropriate Shock or Trauma Protocol as indicated

No
Monitor and reassess
Continue General Patient Care and Transport

Heat Stroke
High body temp >104, hot, dry skin hypotension, AMS/coma

Airway as indicated
Altered Mental Status as indicated
Active cooling measures
Vascular Access
NS or LR bolus 500 ml IV/IO; repeat to effect SBP >90; max 2 L
Cardiac monitor

Poor perfusion?
Yes

No

Heat-Related Illness (revised and MAB approved 4-7-2021)
### History
- Age, very old and young
- Exposure to increased temperatures and/or humidity
- Past medical history/medications
- Time and duration of exposure
- Poor PO intake, extreme exertion
- Fatigue and/or muscle cramping

### Signs and Symptoms
- AMS/coma
- Hot, dry, or sweaty skin
- Hypotension or shock
- Seizures
- Nausea

### Differential
- Fever
- Dehydration
- Medications
- Hyperthyroidism
- DTs
- Heat cramps, heat exhaustion, heat stroke
- CNS lesions or tumors

### Pearls
- Recommended exam: Mental Status, Skin, Heart, Lung, Abdomen, Extremities, Neuro.
- Extremes of age are more prone to heat emergencies.
- Cocaine, amphetamines, and salicylates may elevate body temperatures.
- Sweating generally disappears as body temperatures rise over 104° F (40° C).
- Intense shivering may occur as patient is cooled.
- Active cooling includes application of cold packs or ice (not directly on skin), fanning either by air conditioning or fanning.
- Cold Saline is not to be administered for the treatment of hyperthermia unless directed by telemetry physician.

### Heat Cramps
- Consist of benign muscle cramping caused by dehydration and is not associated with an elevated temperature.

### Heat Exhaustion
- Consists of dehydration, salt depletion, dizziness, fever, AMS, headache, cramping, N/V. Vital signs usually consist of tachycardia, hypotension and elevated temperature.

### Heat Stroke
- Consists of dehydration, tachycardia, hypotension, temperature >104° F (40° C), and AMS.

### Active Cooling Measures
- Cold packs
- Ice (do not place directly onto patient’s skin)
- Fanning
- Air Conditioning
Hyperkalemia (Suspected)

General Adult Assessment

Cardiac monitor

12-Lead ECG

ALBUTEROL
2.5 mg in 3 ml
continuous SVN

Bradycardia,
Peaked T waves,
Widened QRS, or
Cardiac Arrest

Continue to monitor

Other treatment protocols as indicated

Yes

No

CALCIUM CHLORIDE
1 g slow IVP/IO

SODIUM BICARBONATE
1 mEq/kg slow IVP/IO

Continue General Adult Assessment
### History
- History of renal failure
- History of dialysis
- Trauma, crush injury

### Signs and Symptoms
- Cardiac conduction disturbances
- Irritability
- Abdominal distension
- Nausea
- Diarrhea
- Oliguria
- Weakness

### Differential
- Cardiac disease
- Renal failure
- Dialysis
- Trauma

### Pearls
- Patients must have suspected hyperkalemia OR electrocardiographic findings consistent with hyperkalemia (bradycardia with widening QRS complexes) BEFORE initiating treatment.
- Calcium Chloride is contraindicated in patients taking digitalis products.
- Hyperkalemia is defined as a potassium level higher than 5.5 mmol/L.
- Potassium of 5.5 - 6.5 mmol/L - Tall tented T waves.
- Potassium of 6.5 - 7.5 mmol/L - Loss of P waves.
- Potassium of 7.5 - 8.5 mmol/L - Widening QRS.
- Potassium of >8.5 mmol/L - QRS continues to widen, approaching sine wave.
Obstetrical Emergency

General Adult Assessment

Pregnant patient exhibiting seizures?

Yes →

MAGNESIUM SULFATE 4 gm in 50 cc NS over 20 min

If refractory to MAGNESIUM SULFATE, give MIDAZOLAM IN/IM/IV/IO;
0.1 mg/kg; may repeat q 5 min at 0.05 mg/kg IN/IM/IV/IO
Or DIAZEPAM 5mg IV;
May Repeat q 5 Min Additional Doses Require Physician Order

No →

Pregnant patient exhibiting pre-eclampsia?

Yes →

MAGNESIUM SULFATE 2 gm in 50 cc NS over 10 min

Transport to Appropriate Facility

Follow appropriate protocol
History
- Medical history
- Hypertension medication
- Prenatal care
- Prior pregnancies/births
- Previous pregnancy complications

Signs and Symptoms
- Vaginal bleeding
- Abdominal pain
- Seizures
- Hypertension
- Severe headache
- Visual changes
- Edema of the hands or face

Differential
- Pre-eclampsia/eclampsia
- Placenta previa
- Placenta abruptio
- Spontaneous abortion

Pearls
- Recommended exam: Mental Status, Heart, Lung, Abdomen, Neuro.
- Severe headache, vision changes or RUQ pain may indicate pre-eclampsia.
- In the setting of pregnancy hypertension is defined as >140 systolic or >90 diastolic or a relative increase of 30 systolic and 20 diastolic from the patient’s normal pre-pregnancy BP.
- Maintain left lateral position.
- Ask patient to quantify bleeding - number of pads used per hour.
- Any pregnant patient involved in a MVC should be seen by a physician for evaluation.
- Postpartum Eclampsia/Pre-Eclampsia commonly presents up to 48 hours after childbirth. If symptomatic, treat as Eclampsia/Pre-Eclampsia.
- May present up to 6 weeks after childbirth, Assess for history or Pre-Eclampsia/Eclampsia during pregnancy or delivery.
**Overdose/Poisoning**

**General Adult Assessment**

- **A** Extraglottic Airway Device if Indicated
- **P** Endotracheal Intubation if Indicated

**Consider Vascular Access**
- **A** Consider Cardiac Monitor

**Consider potential cause of signs/symptoms**

- **A** Opiate OD
- **A** Cyanide
- **A** Dystonic Reaction
- **P** TCA/ASA OD
- **P** Calcium Channel Blocker OD
- **P** Beta Blocker OD
- **P** Organophosphate Toxicity

**OD**

- **E** NALOXONE 2-4 mg intranasal
- **A** DIPHENHYDRAMINE 50 mg IV/IM/IO
- **E** NALOXONE 2 mg IN/IM/IV/IO may repeat to a max dose of 10 mg

**P**

- **P** SODIUM BICARBONATE 1 mEq/kg IV/IO of 8.4% solution, may repeat once in 3-5 min
- **P** CALCIUM CHLORIDE 1 gm (10%) slow IV/IO
- **P** GLUCAGON 1 mg IM/IV/IO; may repeat once in 3-5 min

**Reassess and Transport as Appropriate**
### History
- Ingestion or suspected ingestion of a potentially toxic agent
- Substance ingested, route, quantity
- Time of ingestion
- Reason (suicidal, accidental, criminal)
- Available medications in home
- Past medical history, medications

### Signs and Symptoms
- Mental status changes
- Hypotension/hypertension
- Decreased respiratory rate
- Tachycardia, dysrhythmias
- Seizures
- SLUDGE
- Malaise, weakness
- GI symptoms
- Dizziness
- Syncope
- Chest pain

### Differential
- TCA overdose
- Acetaminophen OD
- Aspirin
- Depressants
- Stimulants
- Anticholinergic
- Cardiac medications
- Solvents, alcohols, cleaning agents, insecticides

### Pearls
- Recommended exam: Mental Status, Skin, HEENT, Heart, Lung, Abdomen, Extremities, Neuro.
- Calcium Chloride is contraindicated in patients taking digitalis products.
- Overdose or toxin patients with significant ingestion/exposure should be closely monitored and aggressively treated. Do not hesitate to contact medical control if needed.
- In the case of cyanide poisoning, altered mental status may be profound. Profound altered mental status can be defined as a deficit that includes disorientation, bewilderment and difficulty following commands.
- If patient is suspected to have narcotic overdose/hypoglycemia, administer Narcan/Glucose prior to extraglottic device/intubation.
- Poison Control: 1-800-222-1222

### Agents
- Acetaminophen: Initially normal or N/V. Tachypnea and AMS may occur later. Renal dysfunction, liver failure and/or cerebral edema may manifest.
- Depressants: Decreased HR, BP, temp and RR.
- Anticholinergic: Increased HR, increased temperature, dilated pupils and AMS changes.
- Insecticides: May include S/S of organophosphate poisoning.
- Solvents: N/V, cough, AMS.
- Stimulants: Increased HR, BP, temperature, dilated pupils, seizures, and possible violence.
- TCA: Decreased mental status, dysrhythmias, seizures, hypotension, coma, death.
Pain Management

General Adult Assessment

Appropriate treatment protocol

Comfort measures, i.e. patient positioning, splinting, ice, etc.

Vascular Access
Cardiac monitor

KETAMINE 0.2mg/kg IM/IN/IV/IO
No Repeat Dose

*MORPHINE 0.1mg/kg IM/IV/IO; max single dose 10 mg
May repeat dose q 10 min after the first until pain relieved or respiratory depression occurs

FENTANYL 1 mcg/kg IN/IM/IV/IO; max single dose 100 mcg
May repeat dose after 10 minutes

HYDROMORPHONE 0.01 mg/kg IM/IV/IO; max single dose 1mg
May repeat dose after 10 minutes

For nausea/vomiting after pain medication consider:
ONDANSETRON 4 mg ODT/IM/IV/IO
or
DROPERIDOL 1.25 mg IM/IV/IO
or
METOCLOPRAMIDE
10 mg slow IV bolus over 1-2 minutes or IM
or
PROCHLORPERAZINE
Up to 10 mg IV/IM/IO

Contact Medical Control for additional doses

Pain Management (Revised and approved by MAB 5-1-2019)
47
Pearls

- Recommended exam: Respiratory Status, Mental Status, Area of pain, Neuro.
- Pain severity (1-10) is a vital sign to be recorded before and after medication administration and patient hand off.
- Monitor BP and respirations closely as sedative and pain control agents may cause hypotension and/or respiratory depression.
- Consider patient’s age, weight, clinical condition, use of drugs/alcohol, exposure to opiates when determining initial opiate dosing. Weight based dosing may provide a standard means of dosing calculation, but it does not predict response.
- Exercise care when administering opiates and benzodiazepines; this combination results in deeper anesthesia with significant risk of respiratory compromise.
- Burn patients may require more aggressive dosing.
- Administration of Droperidol can result in hypotension, QT prolongation and Torsades de Pointes.

QI Metrics

- Vital signs with O₂ sats recorded.
- Pain scale documented before and after intervention.
- Vital signs repeated after intervention.
- If considering repeat administration of pain medications, nasal cannula capnography must be utilized.
Pulmonary Edema/CHF

General Adult Assessment
Patient in position of comfort

Airway & ventilation adequate?

Ventilation Management

Yes

Oxygen Keep SpO₂ >94%

Vascular Access

ETCO₂ monitoring

Consider CPAP

12-Lead ECG

BP re-assessment

Hypotensive SBP <100 mm Hg

Signs of cardiogenic shock?

Yes

PUSH DOSE PHENYLEPHRINE
100 mcg – 200 mcg IV/IO, may repeat q 2-5 min to maintain SBP >90
(1 ml – 2 ml of a 100 mcg/ml solution)
OR

DOPAMINE
5-20 mcg/kg/min IV/IO, titrate to SBP >90 mm Hg

No

Normotensive SBP >100 mm Hg

NITROGLYCERIN
0.4 mg SL; may repeat q 5 min as long as HR >60 and SYSTOLIC BP >100 mm Hg

Hypertensive DBP >100 mm Hg

NITROGLYCERIN
1.6 mg SL; may repeat q 5 min for DIASTOLIC BP >100 mm Hg

Continue General Adult Assessment
### History
- Congestive heart failure
- Past medical history
- Medications
- Cardiac history

### Signs and Symptoms
- Respiratory distress, bilateral rales
- Apprehension, orthopnea
- JVD
- Pink, frothy sputum
- Peripheral edema
- Diaphoresis
- Hypotension, shock
- Chest pain

### Differential
- MI
- Congestive heart failure
- Asthma
- Anaphylaxis
- Aspiration
- COPD
- Pleural effusion
- Pneumonia
- Pericardial tamponade
- Toxic exposure

### Pearls
- The administration of nitroglycerin is contraindicated for any patient who has used erectile dysfunction medications within the last 48 hours.
- Carefully monitor the patient as you administer interventions.
- Consider MI.
- Allow patient to maintain position of comfort.
- Consider dose related effects of Dopamine: 2-10 mcg/kg/min increases myocardial contractility and HR, improves BP via vasoconstriction; 10-20 mcg/kg/min causes vasoconstriction of renal, mesenteric, and peripheral blood vessels that can result in poor perfusion and renal failure.

### QI Metrics
- Blood pressure reassessed after each nitroglycerin dose.
- ETCO₂ monitored.
Respiratory Distress Protocol

General Adult Assessment
Patient in position of comfort

Airway & ventilation adequate?

Yes

Vascular Access

A

No

Ventilation Management

Bilateral Rales or Signs of Pulmonary Edema

Pulmonary Edema/CHF

Wheezing or Bronchospasm

ALBUTEROL
assist pt w/own MDI

ALBUTEROL
2.5 mg in 3 ml SVN; repeat until improvement

IPRATROPIUM
2.5 ml 0.02% sol’n SVN once; or DuoNeb 3 ml SVN once

Consider CPAP

Consider MAGNESIUM SULFATE
2 g in 50 ml NS over 10 min

Continue General Adult Assessment

Stridor

Nebulized NS SVN

Consider Allergic Reaction

Respiratory Distress Protocol
History
- Asthma, COPD, CHF, chronic bronchitis, emphysema
- Home treatment (oxygen, nebulizers)
- Medication
- Toxic exposure

Signs and Symptoms
- Shortness of breath
- Pursed lip breathing
- Decreased ability to speak
- Increased respiratory rate and effort
- Wheezing, rhonchi
- Use of accessory muscles
- Fever, cough
- Tachycardia

Differential
- Asthma
- Anaphylaxis
- Aspiration
- COPD
- Pleural effusion
- Pneumonia
- Pulmonary embolus
- Pneumothorax
- Cardiac (MI or CHF)
- Pericardial tamponade
- Hyperventilation
- Inhaled toxin

Pearls
- Recommended exam: Mental Status, HEENT, Skin, Neck, Heart, Lungs, Abdomen, Extremities, Neuro.
- Pulse oximetry and end tidal continuous waveform capnography must be monitored.
- Consider MI.
- Allow the patient to assume a position of comfort.
Seizure

General Adult Assessment
Consider Cervical Stabilization

Patient actively seizing?

Patient have a history of seizures?

Is Patient ≥20 weeks pregnant or ≤6 weeks post partum

Obstetrical Emergencies Protocol

Blood glucose testing

BG <60 mg/dl?

D10, 25 g IV/IO; (250 mL of 10% solution) may repeat x 1 in 5 min

GLUCAGON 1 mg IM for no IV access

Persistent (status) or recurrent seizure?

Yes

Glucose test/retest

Ventilation Management

</tbody>
</table>

**Pearls**
- Recommended exam: Mental Status, HEENT, Heart, Lungs, Extremities, Neuro.
- Benzodiazepines are effective in terminating seizures; do not delay IM/IN administration while initiating an IV.
- Status epilepticus is defined as two or more seizures successively without an intervening lucid period, or a seizure lasting over five minutes.
- Grand mal seizures (generalized) are associated with loss of consciousness, incontinence and oral trauma.
- Focal seizures affect only part of the body and are not usually associated with a loss of consciousness.
- Be prepared to address airway issues and support ventilations as needed.
- Consider ETCO₂ monitoring.
Sepsis (Suspected)

General Adult Assessment

Oxygen Keep SpO\(_2\) >94%

Vascular Access

Cardiac Monitoring/Capnography

Does the patient have a known or suspected source of infection AND TWO of the following criteria?

- SBP <90 mm Hg
- HR >90/min
- Respiratory rate >20
- Altered mental status
- Temperature > or = 100.4 F or < or = 96.8 F
- Persistent EtCo\(_2\) <25 on waveform capnography

Facility Code Sepsis notification telemetry immediately upon recognition of patient meeting Sepsis criteria

Alternate appropriate treatment protocols as indicated

NS or LR bolus 500 ml, reassess criteria and re-examine. May repeat x3 for SBP <90, with no rales on lung exam. Max dose 2 liters NS.

If SBP <90 after 2 liters IVF
- PUSH DOSE EPINEPHRINE 1:100,000
  - 5.0 mcg-10.0 mcg IV/IO, may repeat q 2-5 min to maintain SBP >90 (0.5 ml-1 ml of a 1:100,000 solution)
  - OR
- PUSH DOSE PHENYLEPHRINE
  - 100 mcg – 200 mcg IV/IO, may repeat q 2-5 min to maintain SBP >90 (1 ml – 2 ml of a 100 mcg/ml solution)

Consider DOPAMINE
- 5-20 mcg/kg/min; titrate to SBP >90

Continue General Adult Assessment
History

- Age (Common in elderly and very young)
- Presence and duration of fever
- Previously documented infection or illness (UTI, Pneumonia, meningitis, encephalitis, cellulitis, abscesses, etc)
- Recent surgery or invasive procedure
- Any recent hospitalization
- Immunocompromised (transplant, HIV, diabetes, cancer)
- Bedridden or immobile patients
- Prosthetic or indwelling devices
- Immunization status
- Open wounds, even minor ones

Signs and Symptoms

- Hyper or hypothermia
- Rash and/or excessive bruising
- Chills
- Myalgia
- Markedly decreased urine output
- Altered mentation
- Delayed capillary refill
- Elevated blood glucose (unless diabetic)

Differential

- Cardiogenic Shock
- Hypovolemic Shock
- Dehydration
- Hyperthyroidism
- Medication/drug interaction
- Non-septic infection
- Allergic reaction/anaphylaxis
- Toxicological emergency

Pearls

- Early recognition of Sepsis allows for attentive care and early administration of antibiotics.
- Aggressive IV fluid therapy is the most important prehospital treatment for sepsis. Suspected septic patients should receive repeated fluid boluses (to a max total of 2 liters) while being checked frequently for signs of pulmonary edema, especially those patients with known history of CHF or ESRD on dialysis. STOP fluid resuscitation in the setting of pulmonary edema.
- Time NS or LR bolus was initiated and total amount given is to be recorded and reported to hospital staff at patient hand off.
- Septic patients are especially susceptible to traumatic lung injury and ARDS. If artificial ventilation is necessary, avoid ventilating with excessive tidal volumes. If CPAP is utilized, airway pressure should be limited to 5 cm H2O.
- Attempt to identify source of infection (skin, respiratory, etc.) and relay previous treatments and related history to the ED physician and nursing staff.
- Elevated serum lactate levels are a useful marker of hypoperfusion in sepsis and often become elevated prior to the onset of hypotension. ETCO2 levels are inversely proportional to serum lactate levels.
- Disseminated intravascular Coagulation (DIC) is an ominous, late stage manifestation of sepsis characterized by frank, extensive bruising, bleeding from multiple sites, and finally tissue death.
- Conditions such as Crohn’s, psoriasis, rheumatoid arthritis and other autoimmune disorders are now being treated with medications that impair the immune system. These patients need to be considered as immunocompromised.

QI Metrics

- Vital signs to include blood pressure, heart rate, respiratory rate, SpO2, and EtCO2 documented throughout transport.
- Vital signs before, during, and after NS administration.
- Documentation of the time NS or LR was started and total amount given.
For patients with known adrenal insufficiency, administer patient’s own Solu-Cortef (hydrocortisone) as prescribed.

General Adult Assessment

- Oxygen Keep SpO₂ >94%
- Vascular Access
- Cardiac monitor/capnography

Alternative appropriate treatment protocols as indicated

Trauma-related

General Trauma

Non-trauma, Non-cardiogenic

- NS or LR bolus 1000 ml; may repeat x 1 with no rales on lung exam

Cardiogenic

- Appropriate arrhythmia protocol as indicated
- 12-Lead ECG
- Obtain waveform capnography

- NS or LR bolus 500 ml; if no rales on lung exam, may repeat x 1

PUSH DOSE EPINEPHRINE
1:100,000
5.0 mcg – 10 mcg IV/IO, may repeat q 2-5 min to maintain SBP >90
(0.5 ml-1 ml of a 1:100,000 solution)

OR

PUSH DOSE PHENYLEPHRINE
100 mcg – 200 mcg IV/IO q 5 min to maintain SBP >90
(1 ml – 2ml of 100 mcg/ml solution)

OR

DOPAMINE
5-20 mcg/kg/min, titrate to SBP>90

Obtain waveform capnography

Obtain waveform capnography

Continue General Adult Assessment
History
- Blood loss-vaginal bleeding, ectopic, GI bleeding or AAA
- Fluid loss-vomiting, diarrhea, fever
- Infection
- Cardiac tamponade
- Medications
- Allergic reaction
- Pregnancy
- History of poor oral intake

Signs and Symptoms
- Restlessness, confusion
- Weakness, dizziness
- Weak rapid pulse
- Pale, cool, clammy skin
- Delayed capillary refill
- Hypotension
- Coffee-ground emesis
- Tarry stools

Differential
- Hypovolemic shock
- Cardiogenic shock
- Septic shock
- Neurogenic shock
- Anaphylactic shock
- Ectopic pregnancy
- Dysrhythmias
- Pulmonary embolism
- Tension pneumothorax
- Medication effect or overdose
- Vasovagal
- Physiologic (pregnancy)

Pearls
- Recommended exam: Mental Status, Skin, Heart, Lungs, Abdomen, Back, Extremities, Neuro.
- Hypotension can be defined as a systolic BP of <90. This is not always reliable and should be interpreted in context and patient’s typical BP, if known. Shock may present with a normal BP initially.
- Shock often is present with normal vital signs and may develop insidiously. Tachycardia may be the only manifestation.
- Consider all possible causes of shock and treat per appropriate protocol.
- An ETCO2 measurement of <25 mm/hg is indicative of shock

Hypovolemic shock
- Hemorrhage, trauma, GI bleeding, ruptured aortic aneurysm, or pregnancy related bleeding

Cardiogenic shock
- Heart failure, MI, cardiomyopathy, myocardial contusion, toxins

Distributive shock
- Sepsis (consider telemetry of code sepsis to receiving facility), anaphylaxis, neurogenic, toxins

Obstructive shock
- Pericardial tamponade, pulmonary embolus, tension pneumothorax

For patients with known adrenal insufficiency, administer patient’s own Solu-Cortef (hydrocortisone) as prescribed.

Causes of Adrenal Insufficiency:
Addison’s Disease
Congenital Adrenal Hyperplasia
Long term administration of steroids
Others
Smoke Inhalation

General成人 Assessment

Oxygen 100% NRB
Ventilation Management
Cardiac monitor

Vascular Access
NS or LR bolus 500 ml up to max 2000 ml for hypoperfusion

Other treatment protocols (Burns) as indicated

Cardiac arrest or hypotension or profound altered mental status?

Yes
HYDROXOCOBALAMIN 5 g IV over 15 min

No

Transport to closest appropriate Burn Care Center:
Sunrise Hospital
UMC Trauma Center
### History
- Exposed to smoke in a structure fire
- Exposed to smoke in a vehicle fire
- Exposed to smoke from other sources, industrial, confined space, wilderness fire, etc.

### Signs and Symptoms
- Facial burns
- Singed nasal hairs or facial hair
- Shortness of breath
- Facial edema
- Stridor
- Grunting respirations

### Differential
- COPD
- CHF
- Toxic inhalation injury
- Caustic inhalation injury

### Pearls
- Protect yourself and your crew.
- Have a high index of suspicion when treating patients at the scene of a fire.
- If the medication is not available on scene do not delay transport waiting for it.
- Carefully monitor respiratory effort and correct life threats immediately.
- Decide early on if you want to intubate as burned airways swell, making intubation difficult.
- Profound altered mental status can be defined as a deficit that includes disorientation, bewilderment and difficulty following commands.

---

### Preparation and Administration of Hydroxocobalamin

**Complete Starting Dose:** 5 g

1. **Reconstitute:** Place the vial in an upright position. Add **200 mL** of 0.9% Sodium Chloride Injection to the vial using the transfer spike. **Fill to the line.**

   * 0.9% Sodium Chloride Injection is the recommended diluent (diluent not included in the kit). Lactated Ringer's Solution and 5% Dextrose Injection have also been found to be compatible with Hydroxocobalamin.

2. **Mix:** The vial should be repeatedly inverted or rocked, **NOT** shaken, for at least **60 seconds** prior to infusion.

3. **Infuse Vial:** Use vented intravenous tubing, hang and infuse over **15 minutes.**
STEMI (Suspected) (Revised and approved by MAB 5-1-2019)

General Adult Assessment

12-Lead ECG within 5 minutes of patient contact

STEMI

Facility STEMI notification telemetry immediately upon recognition of STEMI

A Vascular Access

E Oxygen

Keep SPO2 >94%

ASPIRIN 324 mg PO

NITROGLYCERIN

Assist pt with own NTG as prescribed; may repeat X 2

0.4 mg SL; may repeat q 5 min X 2

P Pain Management for continued pain

Consider anti-emetic for nausea/vomiting:
ONDANSETRON 4.0 mg ODT/IM/IV/IO
METOCLOPRAMIDE 10 mg slow IV bolus over 1-2 minutes or IM
PROCHLORPERAZINE Up to 10 mg IV/IM/IO

Transport and re-notify receiving facility

Nitroglycerin is contraindicated in any patient with hypotension, bradycardia, tachycardia (HR>100bpm) in the absence of heart failure, evidence of a right ventricular infarction, and use of erectile dysfunction medications within the last 48 hours. Caution is advised in patients with Inferior Wall STEMI and a right-sided ECG should be performed to evaluate RV infarction.

Refer to Arrhythmia and Shock Protocols as needed

Tachycardia/Stable
(Normal Mental Status, Palpable Radial Pulse)

General Adult Assessment
- Cardiac Monitor
- Vascular Access
- 12-Lead ECG

Narrow Complex < 0.11 sec
- Irregular Rhythm
  - Vagal Maneuvers
    - Successful?
      - Yes
        - AMIODARONE 150 mg in 50 cc NS over 10 min
      - No
        - AMIODARONE 150 mg in 50 cc NS over 10 min
    - No
      - Consider NS or LR Bolus 500-1000 cc

- Regular Rhythm
  - Vagal Maneuvers
    - Successful?
      - Yes
        - AMIODARONE 150 mg in 50 cc NS over 10 min
      - No
        - Consider NS or LR Bolus 500-1000 cc

Wide Complex ≥ 0.12 sec
- Undifferentiated Monomorphic VT Suspected to be SVT With Aberrancy
  - Regular Monomorphic VT
    - Vagal Maneuvers
      - Successful?
        - Yes
          - MAGNESIUM SULFATE 2 gm IV/IO in 50cc NS over 10 min
        - No
          - AMIODARONE 150 mg in 50 cc NS over 10 min
  - Torsades De Pointes
    - Vagal Maneuvers
      - Successful?
        - Yes
          - AMIODARONE 150 mg in 50 cc NS over 10 min
        - No
          - MAGNESIUM SULFATE 2 gm IV/IO in 50cc NS over 10 min

Consider Sedation:
- ETOMIDATE 0.15 mg/kg IV/IO
- ETOMIDATE 0.15 mg/kg IV/IO

Synchronized Cardioversion
- Defibrillation

Continue General Patient Care
History
- Medications (aminophylline, diet pills, thyroid supplements, decongestants, digoxin)
- Diet (caffeine)
- Drugs (cocaine, methamphetamines)
- Past medical history
- Syncope/near syncope
- History of palpitations/racing heart

Signs and Symptoms
- Heart rate >150
- Dizziness, CP, SOB
- Diaphoresis
- CHF

Differential
- Heart disease (WPW, valvular)
- Sick sinus syndrome
- MI
- Electrolyte imbalance
- Exertion, fever, pain, emotional stress
- Hypoxia
- Hypovolemia
- Drug effect, overdose
- Hyperthyroidism

Pearls
- Recommended exam: Mental Status, Skin, Heart, Lungs, Abdomen, Back, Extremities, Neuro.
- Carefully monitor patients as you treat them; stable tachycardia may convert to unstable rhythms/conditions quickly.
- Sedate patients prior to cardioversion, if time allows.
Tachycardia / Unstable
(Mental Status Changes, No Palpable Radial Pulse)

- **General Adult Assessment**
  - **P**: Cardiac monitor
  - **A**: Vascular Access

#### Narrow Complex ≤0.11 Sec

- **P**: If IV established, administer ADENOSINE 12 mg rapid IVP/IO

  - **Yes**: Rhythm change?
    - **No**: Synchronized Cardioversion; consider sedation: ETOMIDATE 0.15 mg/kg IV/IO
      - **Yes**: Rhythm change?
        - **No**: Repeat synchronized cardioversion; assess need for repeat sedation
          - **Yes**: Rhythm change?

          - **Yes**: Repeat synchronized cardioversion or defibrillate if VT not resolved; assess need for repeat sedation
            - **No**: Transport
      - **Yes**: Rhythm change?
        - **No**: Repeat defibrillation; assess need for repeat sedation
          - **Yes**: Continue general adult assessment
          - **No**: Transport
    - **Yes**: Rhythm change?
      - **No**: Repeat synchronized cardioversion; assess need for repeat sedation
  - **No**: Transport

#### Wide Complex ≥0.12 Sec

- **P**: Torsades de Pointes (Polymorphic Ventricular Tachycardia)

  - **P**: Defibrillate; consider sedation: ETOMIDATE 0.15 mg/kg IV/IO
    - **Yes**: Rhythm change?
      - **No**: MAGNESIUM SULFATE 2 gm IV/IO in 50 cc NS over 10 min
      - **Yes**: Rhythm change?
        - **No**: AMIODARONE 150 mg in 50 cc NS over 10 min
        - **Yes**: Rhythm change?
          - **No**: Continue general adult assessment
          - **Yes**: Transport
      - **Yes**: Rhythm change?
        - **No**: Repeat synchronized cardioversion or defibrillate if VT not resolved; assess need for repeat sedation
        - **Yes**: Continue general adult assessment
        - **No**: Transport

- **P**: Monomorph VT

  - **P**: Defibrillate; consider sedation: ETOMIDATE 0.15 mg/kg IV/IO
    - **Yes**: Rhythm change?
      - **No**: No transport
      - **Yes**: No transport

---

*Tachycardia / Unstable*
History
- Medications (aminophylline, diet pills, thyroid supplements, decongestants, digoxin)
- Diet (caffeine)
- Drugs (cocaine, methamphetamines)
- Past medical history
- Syncope/near syncope
- History of palpitations/racing heart

Medications
- Aminophylline,
- Diet pills,
- Thyroid supplements,
- Decongestants,
- Digoxin

Diet
- Caffeine

Drugs
- Cocaine,
- Methamphetamines

Past medical history
- Syncope/near syncope
- History of palpitations/racing heart

Signs and Symptoms
- Cardiac arrest
- Heart rate >150
- Dizziness, CP, SOB
- Diaphoresis
- CHF

Differential
- Heart disease (WPW, valvular)
- Sick sinus syndrome
- MI
- Electrolyte imbalance
- Exertion, fever, pain, emotional stress
- Hypoxia
- Hypovolemia
- Drug effect, overdose
- Hyperthyroidism

Pearls
- Recommended exam: Mental Status, Skin, Heart, Lungs, Abdomen, Back, Extremities, Neuro.
- If patient is in arrest, efforts should focus on quality chest compressions and rhythm correction.
- Administer Adenosine at a proximal IV site, rapidly followed by a saline flush.
Target Temperature Management & Post-Resuscitation Care (revised and MAB approved 4-7-2021)

General Adult Assessment

1. 12-Lead ECG

ROSC w/patient unresponsive to voice or pain?

Yes

Patient meets following criteria:
1. >18 years of age
2. Temp S/P ROSC >34° C (93° F)
3. No purposeful response to voice or pain
4. BG >60
5. Sustained ETCO₂ waveform monitoring in place
6. Cardiac arrest not due to trauma
7. Not pregnant

Yes

P Cardiac monitor, SPO₂, ETCO₂
A Vascular Access x 2
E Neuro exam

E Expose patient; Ice packs to axilla and groin
A COLD NS or LR, 250 ml/hr Up to 1L

Maintain ETCO₂ at approx 40 mmHG; DO NOT HYPERVENTILATE

P DOPAMINE 5-20 mcg/kg/min PRN; Titrate to keep SBP >90 mm Hg

No

Other appropriate treatment protocols as indicated

Yes

* Approved Hypothermia Centers:
- Centennial Hills
- Desert Springs
- Henderson
- Mountain View
- St. Rose Siena
- Southern Hills
- Spring Valley
- Summerlin
- Sunrise
- UMC
- Valley

No

Transport patient to approved Hypothermia Center*
### History
- Non-traumatic cardiac arrest
- Any presenting ECG rhythm

### Signs and Symptoms
- Cardiac arrest
- Return of spontaneous circulation post cardiac arrest

### Differential
- Continue to address rhythm specific differentials

### Pearls
- Hyperventilation is to be avoided in any cardiac arrest/post arrest resuscitation.
- Initial ETCO₂ may be elevated immediately post resuscitation but will normalize.
- Transport to a hypothermia center as listed is required for continued management of the post arrest patient.
Ventilation Management

**Basic Airway Maneuvers**
- Open Airway Chin Lift/Jaw Thrust
- NPA or OPA as needed
- Suction as needed

**Consider**
- Cervical Stabilization
- Altered Mental Status/Syncope

- Use supplemental oxygen to maintain an oxygen saturation of >94% or >90% for patients on home oxygen for chronic conditions

**Administer Oxygen**
- BVM as needed

**Intervention effective?**
- Yes
- No

**Extraglottic Airway**
- Obtain Vascular Access

**Endotracheal Intubation**
- Prep the Nostrils With PHENYLEPHRINE 1-2 Sprays Each
- Or OXYMETAZOLINE 1-2 sprays each nostril
- and LIDOCAINE 2% Lubricant

**Consider Induction**
- Administer ETOMIDATE 0.3 mg/kg IV/IO Or KETAMINE 2 mg/kg IV/IO Or 4 mg/kg IM

**Maintain Sedation**
- Administer MIDAZOLAM 0.1 mg/kg IV/IN/IM/IO;
  - May Repeat q 5 Minutes at 0.05 mg/kg IV/IN/IM/IO Or;
  - DIAZEPAM 5 mg IV/IO; May Repeat Dose after 5 Minutes With Physician Order

**Extraglottic/ETT**
- Placement successful?
  - Yes
  - No

**Able to ventilate without extraglottic/ETT in place?**
- Yes
- No

**Cricothyroidotomy**

**Respiratory Distress and/or Tracheostomy Tube Replacement Protocol if needed**

**Continue Care and Transport as Appropriate**
Always weigh the risks and benefits of endotracheal intubation in the field against transport. All prehospital endotracheal intubations are considered high risk. If ventilation/oxygenation is adequate, transport may be the best option. The most important airway device and the most difficult to use correctly and effectively is the Bag Valve Mask (not the laryngoscope). Few prehospital airway emergencies cannot be temporized or managed with proper BVM techniques.

**DIFFICULT AIRWAY ASSESSMENT:**

**Difficult BVM Ventilation-MOANS:** Difficult Mask seal due to facial hair, anatomy, blood or secretions/trauma; Obese or late pregnancy; Age >55; No teeth (roll gauze and place between gums and cheeks to improve seal); Stiff or increased airway pressures (asthma, COPD, obese, pregnant).

**Difficult Laryngoscopy-LEMON:** Look externally for anatomical distortions (small mandible, short neck, large tongue); Evaluate 3-3-2 Rule (Mouth open should accommodate 3 patient fingers, mandible to neck junction should accommodate 3 patient fingers, chin-neck junction to thyroid prominence should accommodate 2 patient fingers); Mallampati (difficult to assess in the field); Obstruction / Obese or late pregnancy; Neck mobility.

**Difficult Extraglottic Device Placement-RODS:** Restricted mouth opening; Obstruction / Obese or late pregnancy; Distorted or disrupted airway; Stiff or increased airway pressures (asthma, COPD, obese, pregnant).

**Nasotracheal intubation:** Orotracheal intubation is the preferred choice. Procedure requires patient to have spontaneous breathing. Contraindicated in anatomically disrupted or distorted airways, increased intracranial pressure, severe facial trauma, basal skull fracture, head injury.

**Pearls**

- Capnometry (Color) or capnography is mandatory with all methods of intubation. Document results.
- Continuous capnography (ETCO$_2$) is mandatory for the monitoring of all patients with an ET tube.
- If an effective airway is being maintained by BVM and/or basic airway adjuncts (e.g. nasopharyngeal airway) with continuous pulse oximetry values of ≥90% or values expected based on pathophysiologic condition with otherwise reassuring vital signs (e.g. pulse oximetry of 85% with otherwise normal vitals in a post-drowning patient), it is acceptable to continue with basic airway measures instead of using an extraglottic airway device or intubation. Consider CPAP as indicated by protocol and patient condition.
- For the purposes of this protocol, a secure airway is achieved when the patient is receiving appropriate oxygenation and ventilation.
- An intubation attempt is defined as passing the laryngoscope blade or endotracheal tube past the teeth or inserted into the nasal passage.
- An appropriate ventilatory rate is one that maintains an ETCO$_2$ of 35 - 45. Avoid hyperventilation.
- Paramedics should use an extraglottic airway device if oral-tracheal intubation is unsuccessful.
- Maintain C-spine stabilization for patients with suspected spinal injury.
- Cricoid pressure and BURP maneuver may assist with difficult intubations. They may worsen view in some cases.
- Gastric tube placement should be considered in all intubated patients, if time allows.
- It is important to secure the endotracheal tube well.
PEDIATRIC TREATMENT PROTOCOLS

(for patients under 12 years of age)
General Pediatric Assessment

Scene Safety / Scene Size-Up
Nature of Call / Mechanism of Injury

Vascular Access as indicated
Oxygen therapy to keep SpO₂ >94%

Pain Management as indicated

Radio Contact for all pediatric patients.

Transport per Pediatric Destination Criteria

Transport to closest facility for:
- Airway emergencies (inability to adequately ventilate)
Pearls
- For all scenes where patient needs exceed available EMS resources, initial assessment and treatment shall be in accordance with an approved triage methodology.
- Correct life-threatening problems as identified.
- If the ability to adequately ventilate a patient cannot be established, the patient must be transported to the nearest emergency department.
- Never withhold oxygen from a patient in respiratory distress.
- Contact with online medical control should be established by radio. Telephone contact may only be used if the call is routed via a recorded phone patch through the FAO at 702-382-9007.

Disposition
- Patients sustaining traumatic injuries shall be transported in accordance with the Trauma Field Triage Criteria Protocol.
- Patients sustaining burn injuries shall be transported in accordance with the Burns Protocol.
- Pediatric patients (<18 y/o for transport purposes only) shall be transported in accordance with the Pediatric Destination Protocol.
- Patients with evidence of a stroke shall be transported in accordance with the Stroke Protocol.
- Sexual assault victims <13 y/o shall be transported to Sunrise Hospital.
- Sexual assault victims 13 y/o up to 18 y/o shall be transported to Sunrise Hospital or UMC.
- Sexual assault victims 18 y/o and older shall be transported to UMC.
- For sexual assault victims outside a 50-mile radius from the above facilities, the patient shall be transported to the nearest appropriate facility.
- Stable patients shall be transported to the hospital of their choice; if the patient has no preference, the patient should be transported to the closest facility.

Internal Disaster
- If a hospital declares an internal disaster, that facility is to be bypassed for all patients except patients in cardiac arrest, or in whom the ability to adequately ventilate has not been established.
- Operational exceptions may be initiated in regard to transport to hospitals on internal disaster.
General Pediatric Trauma Assessment

General Pediatric Assessment
Cervical Stabilization

Glasgow Coma Score

GCS <8

Ventilation Management
BVM if O₂ sat ≤94%

No

Sucking chest wound
Control active hemorrhage
Obvious fractures
Suspected traumatic brain injury
Open wounds

P Needle Thoracentesis
Apply 3-sided occlusive dressing
Hemorrhage Control Tourniquet
Immovilize fractures; assess distal pulse
Raise Head of bed 30 degrees & Capnography–ETCO₂ 35 mm Hg
Cover with gauze; wet trauma dressing for abdominal evisceration

P Pain Management

Transport & Radio Contact to appropriate trauma center based on TFTC

General Pediatric Trauma Assessment Protocol (revised and MAB approved 4-7-2021)
### History
- Time and mechanism of injury
- Damage to structure or vehicle
- Location in structure or vehicle
- Others injured or dead
- Speed and details of MVC
- Restraints/protective equipment
- Past medical history
- Medications

### Signs and Symptoms
- Pain, Swelling
- Deformity, lesions, bleeding
- AMS or unconscious
- Hypotension or shock
- Arrest

### Differential (Life threatening)
- Tension pneumothorax
- Flail chest
- Pericardial tamponade
- Open chest would
- Hemothorax
- Intra-abdominal bleeding
- Pelvis/femur fracture
- Spine fracture/cord injury
- Head injury
- Extremity fracture
- HEENT (airway obstruction)
- Hypothermia

### Pearls
- Recommended exam: Mental Status, Skin, HEENT, Heart Lung, Abdomen, Extremities, Back, Neuro.
- Transport destination is based on the Trauma Field Triage Criteria Protocol.
- Transport should not be delayed for procedures; ideally procedures should be performed enroute when possible.
- BVM is an acceptable method of ventilating and managing an airway if pulse oximetry can be maintained ≥90%.
- Pediatric patients should be evaluated with a high index of suspicion; occult injuries may be present and pediatric patients can decompensate quickly.
Pediatric Abdominal Pain, Nausea & Vomiting

General Pediatric Assessment

Hypovolemia or witnessed vomiting?

Yes

- Vascular Access
  - NS or LR 20 ml/kg IV; may repeat up to 60 ml/kg

No

Subjective nausea or vomiting?

Yes

- ONDANSETRON
  - 0.15 mg/kg ODT/IM/IV/IO up to max dose 4 mg**
  - OR
  - If 8 years of age or older, METOCLOPRAMIDE 5 mg slow IV/IO bolus over 1-2 minutes or IM

No

- Reassess
- Transport to Pediatric Facility

**Round up to nearest ½ pill

(Revised and MAB approved 4-7-2021)
### History
- Age
- Medical/surgical history
- Onset
- Quality
- Severity
- Fever

### Signs and Symptoms
- Pain location
- Tenderness
- Nausea
- Vomiting
- Diarrhea
- Dysuria
- Constipation

### Differential
- Liver (Hepatitis)
- Gastritis
- Pancreatitis
- Kidney stone
- Appendicitis
- Bladder
- Bowel obstruction
- Gastroenteritis

### Pearls
- **Recommended Exam:** Mental Status, Skin, HEENT, Heart, Lung, Abdomen, Back, Extremities, Neuro.
- Document mental status and vital signs prior to administration of anti-emetics & pain management.
- Repeat vital signs after each fluid bolus.
- Consider retroperitoneal palpation for kidney pain.
- Pediatric fluid bolus is 20 ml/kg; may repeat to a maximum of 60 ml/kg.
- If there is suspicion that the patient is in DKA, do not exceed 20 ml/kg NS or LR.
- Morphine is not recommended in children for abdominal pain.
- Consider cardiac and ETCO$_2$ monitoring.
Pediatric Allergic Reaction

**General Pediatric Assessment**

- Evidence of airway involvement/breathing difficulties?
  - No
    - **Vascular Access**
      - **DIPHENHYDRAMINE**
        - 1 mg/kg IM/IV/IO; max 50 mg
        - DIPHENHYDRAMINE PO
          - Less than 6 years: 12.5 mg PO
          - 6 to 12 years: 25 mg PO
          - > 12 years: 50 mg PO
      - **Reassess patient q 5 min**
  - Yes
    - **EPINEPHRINE**
      - **Assist patient with own auto-injector**
      - **EPINEPHRINE 1:1000,**
        - 0.01 mg/kg IM;
        - max single dose 0.5 mg;
        - may repeat q 5 min
        - up to max 1.5 mg
    - **ALBUTEROL**
      - **Assist patient with MDI**
      - **2.5 mg SVN; repeat as needed**

**Ventilation Management**

- **Cardiac monitor**
  - **IV access**
    - 20 ml/kg NS or LR bolus;
    - may repeat up to 60 ml/kg
- **DIPHENHYDRAMINE**
  - 1 mg/kg IM/IV/IO; max 50 mg
  - DIPHENHYDRAMINE PO
    - Less than 6 years: 12.5 mg PO
    - 6 to 12 years: 25 mg PO
    - > 12 years: 50 mg PO
- **Continue General Pediatric Assessment**
**History**
- Onset and location
- Insect sting or bite
- Food allergy/exposure
- Medication allergy/exposure
- New clothing, soap, detergent
- Past history of reactions
- Past medical history
- Medication history

**Signs and Symptoms**
- Itching or hives
- Coughing/wheezing or respiratory distress
- Throat or chest constriction
- Difficulty swallowing
- Hypotension/shock
- Edema
- Nausea/vomiting

**Differential**
- Urticarial (rash only)
- Anaphylaxis (systemic effect)
- Shock (vascular effect)
- Angioedema (drug induced)
- Aspiration/airway obstruction
- Asthma/COPD
- CHF

**Pearls**
- Recommended Exam: Mental Status, Skin, Heart, Lung.
- Anaphylaxis is an acute and potentially lethal multisystem allergic reaction.
- Epinephrine is a first-line drug that should be administered in acute anaphylaxis (moderate/severe symptoms). IM Epinephrine (1:1,000) should be administered in priority before or during attempts at IV or IO access.
- Contact Medical Control for refractory anaphylaxis.

**Severity**
- **Mild** reactions involve skin rashes, itchy sensation or hives with no respiratory involvement.
- **Moderate** reactions involve skin disorders and may include some respiratory involvement like wheezing, yet the patient still maintains good tidal volume air exchange.
- **Severe** reactions involve skin disorders, respiratory difficulty, and may include hypotension.

**Special Considerations**
- Always perform ECG monitoring when administering Epinephrine.
- Consider Dopamine for hypotension refractory to administration of Epinephrine.
- Provide oxygen and airway support as needed.

**QI Metrics**
- Epinephrine given appropriately.
- Airway assessment documented.
Pediatric Altered Mental Status

General Pediatric Assessment

- BG <60 mg/dl
  - Blood glucose testing
  - Vascular Access

- BG >60 mg/dl
  - Cardiac monitor
  - 12-Lead ECG

- BG <40 mg/dl in newborn
  - ORAL GLUCOSE if patient protecting airway
  - D10, 5 ml/kg IV/IO max single dose 25 gm
  - GLUCAGON 0.5 mg IM (<20 kg); 1 mg IM (>20 kg) for no IV access
  - Consider NS or LR 20 ml/kg IV; may repeat up to 60 ml/kg; if BG >250, then 10 ml/kg bolus

- Improved mental status?
  - Yes
    - Other treatment protocols as indicated
  - No
    - Consider the Following:
      - Evidence of a seizure of post-ictal state?
        - Seizure
      - Signs of hypoperfusion?
        - Shock
      - Signs of trauma or head injury?
        - General Trauma
      - If unresponsive, with respiratory depression & suspected narcotic overdose
        - Overdose/Poisoning

- Treat hypoglycemia and suspected narcotic overdose before using advanced airways!!

Continue General Pediatric Assessment
Pediatric Altered Mental Status (revised and MAB approved 4-7-2021)
Consider medical causes for the patient’s behavior:
1. Hypoxia
2. Intoxication / Overdose
3. Hypoglycemia / Electrolytes
4. Head Injury
5. Post-ictal State

Implement the S.A.F.E.R. model

Threatened or acted in a way that suggests threat to self or others

Yes

Consider Benzodiazepine IM

2-point restraints; consider law enforcement escort; or 4-point restraints if needed

Transport to a Pediatric Facility

No

Transport to a Pediatric Facility as appropriate

Protocol for pediatric patients <12 yrs old
### History
- Situational crisis
- Psychiatric illness/medications
- Injury to self or threat to others
- Medic Alert tag
- Substance abuse/overdose
- Diabetes

### Signs and Symptoms
- Anxiety, agitation, confusion
- Affect change, hallucinations
- Delusional thoughts, bizarre behavior
- Combative, violent
- Expression of suicidal/homicidal thoughts

### Differential
- Altered mental status differential
- Alcohol intoxication
- Toxin/substance abuse
- Medication effect or overdose
- Withdrawal syndromes
- Depression
- Bipolar
- Schizophrenia
- Anxiety disorder

### Pearls
- Midazolam is **NOT** recommended for use in children for behavioral emergencies.
- Law enforcement assistance should be requested on all calls involving potentially violent patients.
- Under no circumstances are patients to be transported restrained in the prone position.
- Recommended Exam: Mental Status, Skin, Heart, Lung, Neuro.
- Consider all possible medical/trauma causes for behavior.
- Do not irritate the patient with a prolonged exam.
- EMS providers are mandatory reporters in regard to suspected abuse of any vulnerable person.
- Consider cardiac and ETCO$_2$ monitoring.

### Dystonic Reaction
- Condition causing involuntary muscle movements or spasms typically of the face, neck and upper extremities.
- Typically an adverse reaction to drugs such as Haloperidol (may occur with administration).
- When recognized, administer Diphenhydramine 1 mg/kg up to 50 mg IM/IV.

### S.A.F.E.R.
- Stabilize the situation by containing and lowering the stimuli.
- Assess and acknowledge the crisis.
- Facilitate the identification and activation of resources (chaplain, family, friends or police).
- Encourage patient to use resources and take actions in his/her best interest.
- Recovery or referral – leave patient in care of responsible person or professional, or transport to appropriate facility.
Pediatric Bradycardia

General Pediatric Assessment

Ventilation Management

Bradycardia causing hypotension, altered mental status, poor perfusion or shock?

Identify underlying cause
E Blood glucose testing
A Consider Vascular Access
P Cardiac monitor
Consider Overdose/Poisoning

Monitor, Reassess, Transport to Pediatric Facility

Yes

HR < 60 bpm?

Identify underlying cause
E Blood glucose testing
A Vascular Access
P Cardiac monitor

No

CPR
EPINEPHRINE 1:10,000 0.01 mg/kg IV/IO
1:1000 0.1 mg/kg via ETT (max 1 mg); repeat q 3-5 min
ATROPINE 0.02 mg/kg IV/IO (min dose 0.1 mg; max 0.5 mg)
may repeat once after 5 min

NS or LR bolus 20 ml/kg; may repeat up to 60 ml/kg

EPINEPHRINE 1:10,000 0.01 mg/kg IV/IO
1:1000 0.1 mg/kg via ETT (max 1 mg); repeat q 3-5 min
ATROPINE 0.02 mg/kg IV/IO (min dose 0.1 mg; max 0.5 mg);
may repeat q 5 min x 1
Consider Transcutaneous Pacing

Cardiac Arrest

Pulseless

Reassess
Notify Receiving Hospital

Notify Receiving Hospital

No
### History
- Respiratory insufficiency
- Past medical history
- Medications
- Pacemaker

### Signs and Symptoms
- HR <60/min with hypotension, acute altered mental status, chest pain, acute CHF, seizures, syncope, or shock secondary to bradycardia
- Respiratory distress

### Differential
- Hypoxia
- Hypothermia
- Sinus bradycardia
- Athletic
- Head injury (elevated ICP)
- Spinal cord lesion
- Overdose

### Pearls
- Pediatric pacing is by Telemetry Physician order only.
- Recommended Exam: Mental Status, HEENT, Heart, Lung, Neuro.
- Bradycardia causing symptoms is typically <50/minute. Rhythm should be interpreted in the context of symptoms and pharmacological treatment given only when symptomatic; otherwise, monitor and reassess.
- Identifying signs and symptoms of poor perfusion caused by bradycardia are paramount.
- Hypoxemia is a common cause of bradycardia; be sure to oxygenate the patient and provide ventilatory support as needed.
General Pediatric Assessment

Thermal Exposure

Stop the burning process with water or saline
Remove smoldering clothing and jewelry
Do not remove STUCK clothing

Ventilation Management

Cover burned area with dry sterile dressing
DO NOT USE any ice, lotion, ointment or antiseptic!

Vascular Access

IVF – Age 13 and older 500 ml NS or LR fluid bolus
Age 6-12 250 ml NS or LR fluid bolus
Age 5 years or less 125 ml fluid bolus
if signs of hypoperfusion, OR >20% BSA burn present;
Contact Medical Direction at Burn Center for further drip rates or additional boluses

Cardiac monitor

Eye Involvement?
Continuous saline flush in affected eyes.
Flush with water or NS for 10-15 min
Remove jewelry, constricting items, and expose burned area
Identify entry and exit sites, apply sterile dressings

Vascular Access

IVF – Age 13 and older 500 ml NS or LR fluid bolus
Age 6-12 250 ml NS or LR fluid bolus
Age 5 years or less 125 ml fluid bolus
if signs of hypoperfusion, OR >20% BSA burn present;
Contact Medical Direction at Burn Center for further drip rates or additional boluses

Cardiac monitor

Pain Management

Consider Smoke Inhalation

Transport to closest appropriate Burn Care Center
Sunrise Hospital
UMC Pediatric ED

Pain Management

Eye Involvement?
Continuous saline flush in affected eyes.
Flush with water or NS for 10-15 min
Remove jewelry, constricting items, and expose burned area
Identify entry and exit sites, apply sterile dressings

Vascular Access

IVF – Age 13 and older 500 ml NS or LR fluid bolus
Age 6-12 250 ml NS or LR fluid bolus
Age 5 years or less 125 ml fluid bolus
if signs of hypoperfusion, OR >20% BSA burn present;
Contact Medical Direction at Burn Center for further drip rates or additional boluses

Cardiac monitor

Pain Management

Consider Smoke Inhalation

Transport to closest appropriate Burn Care Center
Sunrise Hospital
UMC Pediatric ED
History
- Type of exposure (heat, gas, chemical)
- Inhalational injury
- Time of injury
- Past medical history & medications
- Other trauma
- Loss of consciousness
- Tetanus/immunization status

Signs and Symptoms
- Burns, pain, swelling
- Dizziness
- Loss of consciousness
- Hypotension/shock
- Airway compromise/distress
- Wheezing
- Singed facial or nasal hair
- Hoarseness or voice changes

Differential
- Superficial (1st degree) – red and painful
- Partial Thickness (2nd degree) – blistering
- Full Thickness (3rd degree) – painless/charred or leathery skin
- Thermal
- Chemical
- Electrical
- Radiation
- Lightning

### Pearls
- Burn patients are trauma patients; evaluate for multisystem trauma.
- Assure whatever has caused the burn, is no longer contacting the injury. (Stop the burning process!)
- Recommended Exam: Mental Status, HEENT, Neck, Heart, Lungs, Abdomen, Extremities, Back, Neuro.
- Consider early intubation with patients experiencing significant inhalation injuries.
- Potential CO exposure should be treated with 100% oxygen. (For patients in which the primary event is CO inhalation, transport to a hospital equipped with a hyperbaric chamber is indicated [when reasonably accessible].)
- Circumferential burns to extremities are dangerous due to potential vascular compromise secondary to soft tissue swelling. Elevate extremity.
- Burn patients are prone to hypothermia - never apply ice or cool burns; must maintain normal body temperature.
- Consider ETCO2 monitoring.
- Evaluate the possibility of child abuse with children and burn injuries

### Patients meeting the following Criteria shall be transported to the closest appropriate Burn Care Center:

1. Second degree burns >10% body surface area (BSA).
2. Any Third degree burns.
3. Burns that involve the face, hands, feet, genitalia, perineum, or major joints.
4. Electrical burns including lightning injury.
5. Chemical burns.
6. Circumferential burns.
7. Inhalation burns.
8. Burn injury with concomitant trauma

### Early Intubation Indications
- Signs of Airway Obstruction
- Hoarseness, Stridor, Dysphagia
- Extensive Deep Facial Burns
- Signs of Respiratory Compromise
  - Accessory Muscle Use
  - Inability to Clear Secretions
  - Poor Oxygenation
- Burns in Mouth
- Total BSA ≥ 40%
- Altered Mentation
- Significant Risk of Edema

### Fluid Resuscitation
- 13 years and above 500 ml NS or LR bolus
- 6-12 years 250 ml NS or LR bolus
- 5 years or less 125 ml NS or LR bolus
- Contact Burn Center Medical Direction for additional boluses or drip rates or if it is a prolonged transport.

### Pearls (Electrical)
- Do not contact the patient until you are certain the source of the electric shock has been disconnected.
- Attempt to locate contact points, (entry wound where the AC source contacted the patient; an exit at the ground point); both sites will generally be full thickness.
- Cardiac monitor; anticipate ventricular or atrial irregularity to include V-Tach, V-Fib, heart blocks, etc.
- Attempt to identify the nature of the electrical source (AC vs DC), the amount of voltage and the amperage the patient may have been exposed to during the electrical shock.

### Pearls (Chemical)
- Certainly 0.9% NaCl Sol’n or Sterile Water is preferred; however if it is not readily available, do not delay; use tap water for flushing the affected area or other immediate water sources. Flush the area as soon as possible with the cleanest, readily available water or saline solution using copious amounts of fluids.

---

Pediatric Burns (Revised and MAB approved 4-7-2021)
Pediatric Cardiac Arrest Non-Traumatic

General Pediatric Assessment

IF HYPOXIA IS THE CAUSE OF THE ARREST, EARLY VENTILATION IS RECOMMENDED
Begin Age Appropriate CPR
Push Hard (1.5 Inches Infant 2 Inches in Children) Push Fast (100-120/min)

Address H’s & T’s
P

IF HYPOXIA IS THE CAUSE OF THE ARREST
EARLY VENTILATION IS RECOMMENDED

Use Asystole/PEA Side as Indicated

Check Pulse if Organized Rhythm

If Patient Remains Unresponsive to Resuscitation Efforts Consider Termination of Resuscitation Protocol

Pediatric Cardiac Arrest Non-Traumatic
### History
- Events leading to arrest
- Estimated down time
- Past medical history
- Medications
- Existence of terminal illness

### Signs and Symptoms
- Unresponsive
- Apneic
- Pulseless

### Differential
- Medical vs. Trauma
- VF vs. Pulseless VT
- Asystole
- PEA
- Primary cardiac event vs. respiratory or drug overdose

### Pearls
- Respiratory failure resulting in cardiac arrest should be addressed as it is identified.
- Efforts should be directed at high quality chest compressions with limited interruptions and early defibrillation when indicated.
- Consider early IO placement if IV is difficult.
- DO NOT HYPERVENTILATE.
- Reassess and document ETT placement using auscultation and ETCO₂ capnography.
- Switch compressors every two minutes.
- Try to maintain patient modesty.
- Mechanical chest compression devices should be used if available and appropriate for patient age/size in order to provide for consistent uninterrupted chest compressions and crew safety.
- Adult paddles/pads may be used on children weighing greater than 15 kg.

### H’s & T’s (reversible causes)
- Hypovolemic – Volume infusion
- Hypoxic – Oxygenation & ventilation, CPR
- Hypokalemic (acidosis) – Ventilation, CPR
- Hyperkalemic – Calcium Chloride, Glucose, Sodium Bicarbonate, Albuterol
- Hypothermic
- Hypoglycemic – Glucose
- Tension pneumothorax – Needle decompression
- Tamponade, cardiac – Volume infusion
- Toxins – Agent specific antidote
- Thrombotic, pulmonary – Volume infusion
- Thrombotic, coronary – Emergent PCI
Pediatric Cold-Related Illness

**General Pediatric Assessment**
- Remove from environment
- Temperature measurement (if available)
- Remove wet clothing
- Dry/warm patient
- Passive warming measures

**Hypothermia/Frost Bite**
- Awake with/without altered mental status
- Respiratory distress?
  - Yes → Respiratory Distress
  - No →
    - Localized cold injury
      - Monitor and reassess
      - General wound care
      - DO NOT rub skin to warm
      - DO NOT allow refreezing
    - Systemic hypothermia
      - Unresponsive
      - Pulse present?
        - Yes → Cardiac Arrest
        - No → Continue General Patient Care and Transport

**Active warming measures**
- Vascular Access
- Cardiac monitor
- NS or LR bolus
  - 20 ml/kg IV/IO; repeat to age appropriate effect
  - SBP ≥70 + 2 x Age
  - max 60 ml/kg
- General Pediatric Trauma Assessment
- Pediatric Shock (Non-Trauma)
- Monitor and reassess

Pediatric Cold-Related Illness (revised and MAB approved 4-7-2021)
History
- Age, very young and old
- Exposure to decreased temperatures, but may occur in normal temperatures
- Past medical history/medications
- Drug or alcohol use
- Infections/sepsis
- Time of exposure/wetness/wind chill

Signs and Symptoms
- AMS/coma
- Cold, clammy
- Shivering
- Extremity pain
- Bradycardia
- Hypotension or shock

Differential
- Sepsis
- Environmental exposure
- Hypoglycemia
- Stroke
- Head injury
- Spinal cord injury

Pearls
- Recommended exam: Mental Status, Heart, Lung, Abdomen, Extremities, Neuro.
- Extremes of age are more prone to cold emergencies.
- Obtain and document patient temperature.
- If temperature is unknown, treat the patient based on suspected temperature.
- Hot packs can be used on the armpit and groin; care should be taken not to place the packs directly on the skin.

Hypothermia Categories
- Mild 90°- 95° F (33° - 35° C)
- Moderate 82°- 90° F (28° - 32° C)
- Severe <82° F (<28° C)

Hypothermia Mechanisms
- Radiation
- Convection
- Conduction
- Evaporation
Pediatric Drowning

General Pediatric Assessment

Airway protected & ventilation adequate?

No

Ventilation Management

Consider Cervical Stabilization

Yes

Consider Cervical Stabilization

Oxygen 15 L NRB

SpO₂

Capnography

ALBUTEROL

2.5 mg in 3 ml SVN; repeat until improvement

Consider 12-Lead ECG

Continue General Pediatric Assessment

CAVEATS:
1. Adequate ventilation is KEY!!!
2. For patients breathing on own, start oxygen 15 L NRB; for patients not adequately breathing → BVM
3. Do not suction foam in airway, just bag through it initially.
4. For drowning victims in cardiac arrest, emphasis should be on good oxygenation/ventilation → use traditional 15:2 CPR (no continuous compressions)
History
- Submersion in liquid regardless of depth
- Possible history of trauma (dive)
- Duration of immersion
- Temperature of water or possibility of hypothermia
- Degree of water contamination

Signs and Symptoms
- Unresponsive
- Mental status changes
- Decreased or absent vital signs
- Vomiting
- Coughing, wheezing, rales, stridor, rhonchi
- Apnea
- Frothy/foamy sputum

Differential
- Trauma
- Pre-existing medical condition
- Barotrauma
- Decompression illness
- Post-immersion syndrome

Pearls
- Ensure scene safety.
- Hypothermia is often associated with submersion incidents.
- All patients should be transported for evaluation because of potential for worsening over the next several hours.

QI Metrics
- Complete and submit the SNHD Submersion Incident Report Form.
Pediatric Epistaxis

Active bleeding from the nose?

Compress nose with Direct pressure
Tilt head forward
Position of comfort

Significant or Multi-System Trauma?

General Pediatric Trauma Assessment

Bleeding Controlled?

Would the patient tolerate nasal spray administration?

No

Have patient blow nose
Suction active bleeding

OXYMETAZOLINE
Or
PHENYLEPHRINE
2 Sprays to each nostril. Followed by direct pressure

Yes

No

General Pediatric Assessment

Active bleeding in posterior oropharynx?

Yes

No

No

Yes

General Pediatric Assessment
**Pediatric Epistaxis**

**History**
- Age
- Past Medical History
- Medications (HTN, Anticoagulants, aspirin, NSAIDS)
- Previous episodes of epistaxis
- Trauma
- Duration of bleeding
- Quantity of bleeding

**Signs and Symptoms**
- Bleeding from nasal passages
- Pain
- Nausea
- Vomiting

**Differential**
- Trauma
- Infection (viral URI or Sinusitis)
- Allergic rhinitis
- Lesions (polyps, ulcers)
- Hypertension

**Oxymetazoline (Afrin) and Phenylephrine (Neosynephrine)** should be avoided if child cannot follow instructions to blow their nose, or are unable to tolerate the administration of a nasal medication.

**Pearls**
- Recommended exam: Mental Status, HEENT, Lungs, Neuro
- History should include any clotting disorders such as Hemophilia or Von Willebrand disease, as these can contribute to bleeding.
- Non-accidental trauma as well as foreign body should be considered in pediatric patients with epistaxis.
- It is very difficult to quantify the amount of blood loss with epistaxis
- Bleeding may be also occurring posteriorly. Evaluate for posterior blood loss by examining the posterior pharynx.
- Detailed medication history should be obtained to assess for any NSAIDS, Antiplatelet agents or Anticoagulant medications that may contribute to bleeding.
Pediatric Heat-Related Illness

General Pediatric Assessment

Remove from environment
Temperature measurement (if available)
Remove tight clothing
Passive cooling measures

Symptom Severity

Heat Cramps
Normal to elevated body temp, weakness, muscle cramping

Heat Exhaustion
Elevated body temp cool, moist skin weakness, anxious tachypnea

Heat Stroke
High body temp >104 f hot, dry skin hypotension, altered mental status/coma

PO fluids as tolerated
Monitor and reassess

Active cooling measures
Vascular Access
NS or LR bolus 20 ml/kg IV/IO; repeat to effect age appropriate SBP ≥70 + 2 x Age; max 60 ml/kg
Cardiac monitor

Poor perfusion?
Yes
Exit to appropriate Shock or Trauma Protocol as indicated

No
Monitor and reassess
Continue General Patient Care and Transport

Ventricilation Management as indicated
Altered Mental Status/Syncope as indicated
Active cooling measures
Vascular Access
NS or LR bolus 20 ml/kg IV/IO; repeat to effect age appropriate SBP ≥70 + 2 x Age; max 60 ml/kg
Cardiac monitor

Poor perfusion?
Yes
No
**History**
- Age, very old and young
- Exposures to increased temperatures and/or humidity
- Past medical history/medications
- Time and duration of exposure
- Poor PO intake, extreme exertion
- Fatigue and/or muscle cramping

**Signs and Symptoms**
- AMS/coma
- Hot, dry, or sweaty skin
- Hypotension or shock
- Seizures
- Nausea

**Differential**
- Fever
- Dehydration
- Medications
- Hyperthyroidism
- DTs
- Heat cramps, heat exhaustion, heat stroke
- CNS lesions or tumors

**Pearls**
- Recommended exam: Mental Status, Skin, Heart, Lung, Abdomen, Extremities, Neuro.
- Extremes of age are more prone to heat emergencies.
- Cocaine, amphetamines, and salicylates may elevate body temperatures.
- Sweating generally disappears as body temperatures rise over 104°F (40°C).
- Intense shivering may occur as patient is cooled.
- Active cooling includes application of cold packs or ice (not directly on skin), fanning either by air conditioning or fanning.
- Cold Saline is not to be administered for the treatment of hyperthermia unless directed by telemetry physician.

**Heat Cramps**
- Consist of benign muscle cramping caused by dehydration and is not associated with an elevated temperature.

**Heat Exhaustion**
- Consists of dehydration, salt depletion, dizziness, fever, AMS, headache, cramping, N/V. Vital signs usually consist of tachycardia, hypotension and elevated temperature.

**Heat Stroke**
- Consists of dehydration, tachycardia, hypotension, temperature >104°F (40°C) and AMS.

**Active Cooling Measures**
- Cold packs
- Ice (do not place directly on the skin)
- Fanning
- Air conditioning
Neonatal Resuscitation

Assist mother with delivery as needed

Term gestation? Breathing or crying? Good tone?

- Yes
  - Provide warmth
  - Assure open airway
  - Dry baby

- No
  - Warm, open airway
  - Dry, stimulate baby

HR <100, gasping, or apnea?

- Yes
  - Ventilation Management w/ BVM
  - SpO₂ monitoring
  - Cardiac monitor

- No
  - Labored breathing or persistent cyanosis?

HR <100?

- Yes
  - Ventilation Management

- No
  - HR <60?

- Yes
  - CPR 3:1 ratio
  - Vascular Access

- No
  - EPINEPHRINE 1:10,000; 0.01 mg/kg IV/IO q 3-5 min as needed for HR <60

Transport per Pediatric Destination Protocol; Radio Contact to receiving facility

Caveats:
- Deep airway suctioning is no longer recommended
- Traditional CPR 3:1 ratio is standard for newborns
- Most newborns requiring resuscitation will respond to BVM, compressions and Epi; for those that don’t, consider hypovolemia, pneumothorax, and/or hypoglycemia (BG <40)
History
- Due date
- Time contractions started/duration/frequency
- Rupture of membranes (meconium)
- Time and amount of any vaginal bleeding
- Sensation of fetal movement
- Prenatal care
- Past medical and delivery history
- Medications
- Gravida/Para Status
- High risk pregnancy

Due date
- Time contractions started/duration/frequency
- Rupture of membranes (meconium)
- Time and amount of any vaginal bleeding
- Sensation of fetal movement
- Prenatal care
- Past medical and delivery history
- Medications
- Gravida/Para Status
- High risk pregnancy

Signs and Symptoms
- Spasmodic pain
- Vaginal discharge or bleeding
- Crowning or urge to push
- Meconium

Differential
- Abnormal presentation (breech, limb)
- Prolapsed cord
- Placenta previa
- Abruptio placenta

Pearls
- Recommended Exam: Mental Status, Skin, HEENT, Neck, Chest, Heart, Lungs, Abdomen, Neuro.
- Document all times (delivery, contraction, duration, frequency).
- Some bleeding is normal; copious amounts of blood or free bleeding is abnormal.
- Record APGAR at one and five minutes after birth.
- APGAR of 7-10 is normal, while 4-7 require resuscitative measures
- Transport mother and infant together whenever possible.

APGAR

<table>
<thead>
<tr>
<th>Score=0</th>
<th>Score=1</th>
<th>Score=2</th>
</tr>
</thead>
<tbody>
<tr>

</table>

Caveats:
- Deep airway suctioning no longer recommended.
- Traditional CPR 3:1 ratio is standard for newborns.
- Most newborns requiring resuscitation will respond to BVM, compressions and Epinephrine; for those that don’t, consider hypovolemia, pneumothorax, and/or hypoglycemia (BG <40).
Pediatric Overdose / Poisoning

**General Pediatric Assessment**

- **Endotracheal Intubation if indicated**

**Consider potential cause of signs/symptoms**

- **Opiate OD**
  - **NALOXONE 2-4 mg Intranasal**
  - **NALOXONE 0.1 mg/kg IN/IV/IM** may repeat to a max dose of 10 mg

- **Cyanide**
  - **DIPHENHYDRAMINE 1.0 mg/kg IM/IV/IO; max dose 50 mg**

- **Dystonic Reaction**

- **TCA/ASA OD**
  - **Wide QRS**
  - **HYDROXOCOBALAMIN**
    - See Pediatric Smoke Inhalation Protocol for dosing

- **Calcium Channel Blocker OD**
  - **20 mg/kg CALCIUM CHLORIDE (10%) slow IV/IO**

- **Beta Blocker OD**
  - **ATROPINE 0.02 mg/kg IV/IO q 15 min as needed to decrease secretions and ventilatory resistance; min dose 0.1 mg**

- **Organophosphate Toxicity**
  - **GLUCAGON 0.5 mg IV/IM/IO; may repeat once in 3-5 min**

- **Consider Vascular Access**
  - **Consider cardiac monitor**

- **Endotracheal Intubation if indicated**

**Reassess and Transport as Appropriate**
### History
- Ingestion or suspected ingestion of a potentially toxic agent
- Substance ingested, route, quantity
- Time of ingestion
- Reason (suicidal, accidental, criminal)
- Available medications in home
- Past medical history, medications

### Signs and Symptoms
- Mental status changes
- Hypotension/hypertension
- Decreased respiratory rate
- Tachycardia, dysrhythmias
- Seizures
- SLUDGE
- Malaise, weakness
- GI symptoms
- Dizziness
- Syncope
- Chest pain

### Differential
- TCA overdose
- Acetaminophen OD
- Aspirin
- Depressants
- Stimulants
- Anticholinergic
- Cardiac medications
- Solvents, alcohols, cleaning agents, insecticides

### Pearls
- Pediatric patients should be evaluated by a physician if an overdose/poisoning is suspected regardless of agent, amount or time.
- Recommended exam: Mental Status, Skin, HEENT, Heart, Lung, Abdomen, Extremities, Neuro.
- Calcium Chloride is contraindicated in patients taking digitalis products.
- Overdose or toxin patients with significant ingestion/exposure should be closely monitored and aggressively treated. Do not hesitate to contact medical control if needed.
- In the case of cyanide poisoning, altered mental status may be profound. Profound altered mental status can be defined as a deficit that includes disorientation, bewilderment and difficulty following commands.
- Poison Control: 1-800-222-1222

### Agents
- Acetaminophen: Initially normal or N/V. Tachypnea and AMS may occur later. Renal dysfunction, liver failure and/or cerebral edema may manifest.
- Depressants: Decreased HR, BP, temp and RR.
- Anticholinergic: Increased HR, increased temp, dilated pupils and mental status changes.
- Insecticides: May include S/S of organophosphate poisoning.
- Solvents: N/V, cough, AMS.
- Stimulants: Increased HR, BP, temp, dilated pupils, seizures and possible violence.
- TCA: Decreased mental status, dysrhythmias, seizures, hypotension, coma, death.
Pediatric Pain Management

General Pediatric Assessment

Appropriate treatment protocol

Comfort measures, i.e. patient positioning, splinting, ice, etc.

Vascular Access
Cardiac monitor

For severe pain, consider:

MORPHINE 0.1 mg/kg IM/IV/IO
Maximum single dose 10 mg

OR

FENTANYL 1 mcg/kg IN/IM/IV/IO; maximum single dose 100 mcg
Additional FENTANYL doses require a physician order

ONDANSETRON 0.15 mg/kg ODT/IM/IV/IO
up to max dose 4 mg**
OR
If 8 years of age or older
METOCLOPRAMIDE 5 mg slow IV/IO bolus over 1-2 minutes or IM

Contact Medical Control for additional doses

Continue General Pediatric Assessment

**Round up to nearest ½ pill
**History**
- Age
- Location, duration
- Severity (1-10)
- Past medical history
- Pregnancy status
- Drug allergies and medications

**Signs and Symptoms**
- Severity (pain scale)
- Quality
- Radiation
- Relation to movement, respiration
- Increased with palpation of area

**Differential**
- Musculoskeletal
- Visceral (abdominal)
- Cardiac
- Pleural, respiratory
- Neurogenic
- Renal (colic)

**Pearls**
- Recommended exam: Respiratory Status, Mental Status, Area of pain, Neuro.
- Pain severity (1-10) is a vital sign to be recorded before and after medication administration and patient hand off.
- Monitor BP and respirations closely as sedative and pain control agents may cause hypotension and or respiratory depression.
- Consider patient’s age, weight, clinical condition, use of drugs/alcohol, exposure to opiates when determining initial opiate dosing. Weight based dosing may provide a standard means of dosing calculation but it does not predict response.
- Exercise caution when administering opiates and benzodiazepines; this combination results in deeper anesthesia with significant risk of respiratory compromise.
- Burn patients may require more aggressive dosing.

**QI Metrics**
- Vital signs with O₂ sats documented.
- Pain scale documented before and after each intervention.
- Repeat vital signs after each intervention.
Pediatric Respiratory Distress

General Pediatric Assessment
 Patient in position of comfort

Airway & ventilation adequate?

No

Ventilation Management

Wheezing or Bronchospasm

ALBUTEROL
assist patient w/own MDI

ALBUTEROL
2.5 mg in 3 ml SVN; repeat until improvement

PT >2 y/o with history of wheezing
IPRATROPIUM
2.5 ml 0.02% solution SVN once; or DuoNeb 3 ml SVN once

Consider Vascular Access

Yes

Stridor

Nebulized NS SVN

Provide comfort measures

Consider Vascular Access

For suspected Croup, EPINEPHRINE 1:1000
3-5 mg SVN, if SpO₂ <94%

Consider Allergic Reaction

Continue General Pediatric Assessment
History
- Asthma
- Home treatment (oxygen, nebulizers)
- Medication
- Toxic exposure

Signs and Symptoms
- Shortness of breath
- Purse-lipped breathing
- Decreased ability to speak
- Increased respiratory rate and effort
- Wheezing, rhonchi
- Use of accessory muscles
- Fever, cough
- Tachycardia

Differential
- Asthma
- Anaphylaxis
- Aspiration
- Pleural effusion
- Pneumonia
- Pneumothorax
- Pericardial tamponade (trauma)
- Hyperventilation
- Inhaled toxin

Pearls
- Be prepared to assist ventilations as needed.
- Recommended exam: Mental Status, HEENT, Skin, Neck, Heart, Lungs, Abdomen, Extremities, Neuro.
- Pulse oximetry and end tidal continuous waveform capnography must be monitored.
- Consider MI.
- Allow the patient to assume a position of comfort.
Pediatric Seizure

General Pediatric Assessment

- Patient febrile?
  - Yes: Cool the patient
  - No
- Patient actively seizing?
  - Yes: Blood glucose testing
  - No
- Patient have a history of seizures?
  - Yes
  - No: Blood glucose testing
- BG <60 mg/dl?
  - Yes
  - No: Reassess and monitor VS
- Persistent (status) or recurrent seizure?
  - Yes
  - No: Reassess and monitor VS

**Ventilation Management**

- Cardiac monitor
  - MIDAZOLAM 0.1 mg/kg, IN/IM/IV/IO; max dose 5 mg
  - DIAZEPAM 0.1 mg/kg, IM/IV/IO/PR; max dose 5 mg

**Vascular Access**

**Cardiac monitor**

- MIDAZOLAM 0.1 mg/kg, IN/IM/IV/IO; max dose 5 mg
  - OR
  - DIAZEPAM 0.1 mg/kg, IM/IV/IO/PR; max dose 5 mg

**Blood glucose testing**

- D10, 5 ml/kg IV/IO max single dose 250 ml
- GLUCAGON 0.5 mg IM for no IV access

**Continue General Pediatric Assessment**
### History
- Reported or witnessed seizure activity
- Previous seizure history
- Seizure medications
- History of trauma
- History of diabetes
- Time of seizure onset
- Number of seizures
- Alcohol use, abuse or abrupt cessation
- Fever

### Signs and Symptoms
- Decreased mental status
- Sleepiness
- Incontinence
- Observed seizure activity
- Evidence of trauma
- Unconsciousness

### Differential
- CNS trauma
- Tumor
- Metabolic, hepatic or renal failure
- Hypoxia
- Electrolyte abnormality (Na, Ca, Mg)
- Drugs, medications non-compliance
- Infection, fever
- Alcohol withdrawal
- Hyperthermia
- Hypothermia

### Pearls
- Recommended exam: Mental Status, HEENT, Heart, Lungs, Extremities, Neuro.
- Benzodiazepines are effective in terminating seizures; do not delay IM/IN administration while initiating an IV.
- Status epilepticus is defined as two or more seizures successively without an intervening lucid period, or a seizure lasting over five minutes.
- Grand mal seizures (generalized) are associated with loss of consciousness, incontinence and oral trauma.
- Focal seizures affect only part of the body and are not usually associated with a loss of consciousness.
- Be prepared to address airway issues and support ventilations as needed.
- Consider cardiac and ETCO₂ monitoring.
Pediatric Shock

Estimated Minimum Systolic BP Calculation (Age in Years x 2) + 70

BP calculation applies up to age 10 years

Alternative appropriate treatment protocols as indicated

General Pediatric Assessment

Vascular Access

Cardiac monitor/Capnography

Oxygen 15 L NRB

Trauma-related

Non-Trauma related

For patients with known adrenal insufficiency, administer patient’s own Solu-Cortef (hydrocortisone) as prescribed

Blood glucose testing

NS or LR bolus 20 ml/kg; may repeat x 2 with no rales on lung exam

BG <60 mg/dl
BG <40 mg/dl in newborn

ORAL GLUCOSE if patient protecting airway

D10, 1 ml/kg IV/IO max single dose 250 ml

GLUCAGON 0.5 mg IM (<20 kg); 1 mg IM (>20 kg) for no IV access

NS bolus 10 ml/kg for hypotension; may repeat x 2

BG >250 mg/dl

BG normal

Consider DOPAMINE 5-20 mcg/kg/min IV/IO; titrate to SBP >70 mm Hg + 2 x Age

Continue General Pediatric Assessment

For patients with known adrenal insufficiency, administer patient’s own Solu-Cortef (hydrocortisone) as prescribed.

**Causes of Adrenal Insufficiency:**

**Addison’s Disease**

**Congenital Adrenal Hyperplasia**

**Long term administration of steroids**

**Others**

**Pearls**

- Recommended exam: Mental Status, Skin, Heart, Lungs, Abdomen, Back, Extremities, Neuro.
- Hypotension can be defined as a systolic < Estimated Minimum Systolic. This is not always reliable and should be interpreted in context and patient’s typical BP, if known. Shock may present with a normal BP initially.
- Shock often is present with normal vital signs and may develop insidiously. Tachycardia may be the only manifestation.
- Consider all possible causes of shock and treat per appropriate protocol.

**Hypovolemic shock**

- Hemorrhage, trauma, GI bleeding, ruptured aortic aneurysm or pregnancy-related bleeding

**Cardiogenic shock**

- Heart failure, MI, cardiomyopathy, myocardial contusion, toxins

**Distributive shock**

- Sepsis, anaphylaxis, neurogenic, toxins

**Obstructive shock**

- Pericardial tamponade, pulmonary embolus, tension pneumothorax

---

Pediatric Smoke Inhalation

General Pediatric Assessment

Oxygen Keep SpO₂ > 94%

Ventilation Management

Cardiac monitor

Vascular Access

NS or LR bolus, 20 ml/kg up to 60 ml/kg for hypoperfusion

Other treatment protocols as indicated (Burns)

Cardiac arrest or hypotension or profound altered mental status?

Yes

HYDROXOCOBALAMIN

Reference dosing chart in Pearls

No

Transport to closest appropriate Burn Care Center
Sunrise Hospital
UMC Trauma Center

Pediatric Smoke Inhalation (Revised and MAN approved 4-7-2021)
History
- Exposed to smoke in a structure fire
- Exposed to smoke in a vehicle fire
- Exposed to smoke from other sources, industrial, confined space, wilderness fire etc.

Signs and Symptoms
- Facial burns
- Singed nasal hairs or facial hair
- Shortness of breath
- Facial edema
- Stridor
- Grunting respirations

Differential
- COPD
- CHF
- Toxic inhalation injury
- Caustic inhalation injury

Pearls
- Protect yourself and your crew.
- Have a high index of suspicion when treating patients at the scene of a fire.
- If the medication is not available on scene do not delay transport waiting for it.
- Carefully monitor respiratory effort and correct life threats immediately.
- Decide early on if you want to intubate as burned airways swell making intubation difficult.
- Profound altered mental status can be defined as a deficit that includes disorientation, bewilderment and difficulty following commands.

Pediatric Cyanokit Instructions and Dosing

1. Reconstitute Cyanokit vial per the instructions. The new vial concentration will be 25mg/ml.
2. See chart below to find the appropriate reconstituted dose.

<table>
<thead>
<tr>
<th>APPROXIMATE AGE</th>

3. Withdraw and waste the equivalent volume of Normal Saline from the bag size indicated.
4. Draw the appropriate dose from the vial referencing the chart, using the appropriate syringe size.
5. Inject the reconstituted medication into the appropriate sized bag of Normal Saline, below the Chart.
6. Spike the bag with 15 gtt/ml IV tubing.
7. Piggyback line into an IV/IO line and Infuse over ~15 minutes using the gtt/second noted above.
Pediatric Tachycardia / Stable
(Normal Mental Status, Palpable Radial Pulse)

**Narrow Complex \(\leq 0.11\) Sec**
- Vagal Maneuvers
  - Successful?
    - Yes
    - **AMIODARONE**
      - 5 mg/kg in 50 cc NS over 20 min
    - No
      - **ADENOSINE**
        - 0.2 mg/kg rapid IV/IO push not to exceed 12 mg

**Wide Complex \(\geq 0.12\) Sec**
- **Vascular Access**
- **12-Lead ECG**
- **Torsades de Pointes**
  - (Polymorphic Ventricular Tachycardia)
  - **MAGNESIUM SULFATE**
    - 25 mg/kg IV/IO in 50 cc NS over 10 min
- **Regular Monomorphic VT**
  - Undifferentiated Monomorphic VT
    - Suspected to be SVT with Aberrancy
  - Regular Monomorphic VT
    - **AMIODARONE**
      - 5 mg/kg in 50 cc NS over 20 min
  - **MAGNESIUM SULFATE**
    - 25 mg/kg IV/IO in 50 cc NS over 10 min

- **Synchronized Cardioversion**
  - start at 0.5 to 1 J/kg; may use 2 J/kg if unsuccessful
  - Consider sedation
  - **ETOMIDATE**
    - 0.15 mg/kg IV/IO

- **Continue General Patient Care**

**General Pediatric Assessment**
- Cardiac monitor
- Vascular Access

**Continue General Patient Care**
### History
- Medications
- Diet (caffeine)
- Drugs (cocaine, methamphetamines)
- Past medical history
- Syncope/near syncope
- History of palpitations/racing heart

### Signs and Symptoms
- Heart rate ≥ 180 in children
- Heart rate ≥ 220 in infants
- Dizziness, CP, SOB
- Diaphoresis

### Differential
- Heart disease (WPW, valvular)
- Sick sinus syndrome
- Electrolyte imbalance
- Exertion, fever, pain, emotional stress
- Hypoxia
- Hypovolemia
- Drug effect, overdose
- Hyperthyroidism

### Pearls
- Recommended exam: Mental Status, Skin, Heart, Lungs, Abdomen, Back, Extremities, Neuro.
- Carefully monitor patients as you treat them; stable tachycardias may convert to unstable rhythms/conditions quickly.
- Sedate patients prior to cardioversion, if time allows.
- The most common tachyarrythmia in children is sinus.
Pediatric Tachycardia / Unstable
(Mental Status Changes, No Palpable Radial Pulse)

**Narrow Complex ≤0.11 Sec**
- Cardiac monitor
- Vascular Access
- If IV established, administer ADENOSINE 0.2 mg/kg rapid IV/IO push not to exceed 12 mg
- Rhythm change?
  - No
    - Transport
  - Yes
    - Synchronized Cardioversion start at 0.5 to 1 J/kg; may use 2 J/kg if unsuccessful; Consider sedation ETomidate 0.15 mg/kg IV/IO
    - Rhythm change?
      - No
        - Continue General Patient Care
      - Yes
        - Defibrillate at 2 J/kg increasing to 4 J/kg; Consider sedation ETomidate 0.15 mg/kg IV/IO

**Wide Complex ≥0.12 Sec**
- Torsades de Pointes (Polymorphic V-Tach)
- Defibrillate at 2 J/kg increasing to 4 J/kg; Consider sedation ETomidate 0.15 mg/kg IV/IO
- Rhythm change?
  - No
    - Transport
  - Yes
    - MAGNESIUM SULFATE 25 mg/kg IV/IO in 50 cc NS over 10 min
      - Rhythm change?
        - No
          - Transport
        - Yes
          - Repeat Synchronized Cardioversion or defibrillate if VT not resolved; assess need for repeat sedation; repeat AMIODARONE
    - AMIODARONE 5 mg/kg in 50 cc NS over 20 min
      - Rhythm change?
        - No
          - Transport
        - Yes
          - Repeat Synchronized Cardioversion or defibrillate if VT not resolved; assess need for repeat sedation; repeat AMIODARONE

**Pearls**

- Recommended exam: Mental Status, Skin, Heart, Lungs, Abdomen, Back, Extremities, Neuro.
- If patient is in arrest, efforts should focus on quality chest compressions and rhythm correction.
- Administer Adenosine at a proximal IV site, rapidly followed by a saline flush.
- The most common tachyarrythmia in children is sinus.
Use supplemental oxygen to maintain an oxygen saturation of >94%; >90% for patients on home oxygen for chronic conditions.

Basic Airway Maneuvers
- Open airway, Chin lift/Jaw thrust
- NPA or OPA as needed
- Suction as needed

Consider Cervical Stabilization
Consider Altered Mental Status/Syncope

Administer oxygen
BVM as needed

Intervention effective?

No

Extraglottic Airway
Obtain Vascular Access
Endotracheal Intubation
ECG Monitor

Consider Sedation Administer MIDAZOLAM 0.1 mg/kg IV/IN/IO Titrated to Effect. Maximum Single Dose : 5 mg. Must be Given Slowly Over 3-5 Minutes. Additional Doses by Physician Order Only. Or; KETAMINE 2 mg/kg IV/IO Or 4 mg/kg IM

Maintain Sedation Administer DIAZEPAM 0.2mg/kg IV/IO. Maximum dose 5 mg. May Repeat After 5 Minutes with Physician Order. Or; DIAZEPAM 0.5 mg/kg PR via #5 or #8 French feeding tube, Maximum Dose 20 mg

Extraglottic/ETT placement successful?

Yes

Able to ventilate without extraglottic/ETT in place?

Yes

No

Cricothyroidotomy

Continue Care and Transport as Appropriate
Pearls
- Capnometry (Color) or capnography is mandatory with all methods of intubation. Document results.
- Continuous capnography (ETCO₂) is mandatory for the monitoring of all patients with an ET tube.
- If an effective airway is being maintained by BVM and/or basic airway adjuncts (e.g. nasopharyngeal airway) with continuous pulse oximetry values of ≥90%, or values expected based on pathophysiologic condition with otherwise reassuring vital signs (e.g. pulse oximetry of 85% with otherwise normal vitals in a post drowning patient), it is acceptable to continue with basic airway measures instead of using an extraglottic airway device or intubation.
- For the purposes of this protocol, a secure airway is achieved when the patient is receiving appropriate oxygenation and ventilation.
- An Intubation Attempt is defined as passing the laryngoscope blade or endotracheal tube past the teeth or inserted into the nasal passage.
- An appropriate ventilatory rate is one that maintains an ETCO₂ of 35 - 45. Avoid hyperventilation.
- Paramedics should use an extraglottic airway device if oral-tracheal intubation is unsuccessful.
- Maintain C-spine stabilization for patients with suspected spinal injury.
- Cricoid pressure and BURP maneuver may assist with difficult intubations. They may worsen view in some cases.
- Gastric tube placement should be considered in all intubated patients if time allows.
- It is important to secure the endotracheal tube well.
OPERATIONS
PROTOCOLS
1. Telemetry contact shall be established:
   A. For all time sensitive or life threatening condition transports.
   B. For any medical emergency in which the EMS provider’s judgment suggests consultation with a telemetry physician is necessary.
   C. For all trauma patients going to a trauma center.
   D. When telemetry contact is required per protocol.

2. For patients who meet Trauma Field Triage Criteria, telemetry reports shall include:
   A. ETA
   B. Patient age
   C. Gender
   D. Mechanism of injury
   E. Ambulatory at scene
   F. Suspected injuries
   G. Vital signs
   H. Airway status
   I. Neurologic status
   J. An incident identifier if multiple patients are involved (e.g. fire department command code “Main Street Command”)

3. Notify/meet with the receiving facility prior to transfer of care with suspected need for Contact Isolation Preparation
   A. State the general type of agent involved (insect, chemical, biological, radiation, nuclear, explosive)
   B. State the type of agent if known.
   C. If unknown state the general type with patient symptoms. Example – “Unknown chemical substance causing respiratory distress with secretions.

4. For all other patients, telemetry reports shall include, at a minimum:
   A. Attendant/vehicle identification
   B. Nature of call: INFORMATION ONLY or REQUEST FOR PHYSICIAN ORDERS
   C. Patient information (i.e. number, age, sex)
   D. Patient condition (i.e. stable, full arrest)
   E. History
      1) Basic problem or chief complaint
      2) Pertinent associated symptoms
      3) Time since onset
      4) Past history, if pertinent
   F. Objective findings
      1) General status of patient
      2) Level of responsiveness
      3) Vital signs
      4) Pertinent localized findings
      5) Working impression of patient’s problem
   G. Treatment
      1) In progress
      2) Requests for drugs or procedures
   H. Estimated time of arrival, including any special circumstances that may cause a delay in transport.
   I. For patients meeting “Code White” or “Code STEMI” criteria, a preliminary telemetry report should be made to notify the receiving facility of the type of activation, and an estimated arrival time. An “Information Only” telemetry should follow once transport has been initiated.
5. Notification of transport shall be provided to the receiving hospital for ALL other calls.
   A. Notification can be completed via:
      1) Radio
      2) Telephone
      3) EMSSystem
   B. Notification reports shall include:
      1) Patient age
      2) Chief complaint
      3) Type of bed required (monitored/unmonitored)
      4) Unit number
      5) ETA

6. Providers will relay assessment findings and treatment provided to the individual(s) assuming responsibility for the patient(s).

7. Patient confidentiality must be maintained at all times.

8. All patients should be treated with dignity and respect in a calm and reassuring manner.
1. All patients with absent vital signs who do not have conclusive signs of death (refer to Prehospital Death Determination protocol) shall be treated with life-resuscitating measures unless EMS personnel are presented with a valid Do-Not-Resuscitate (DNR)/Physician Order for Life-Sustaining Treatment (POLST) Identification/Order.

   A. A valid DNR Identification is a form, wallet card, or medallion issued by the Southern Nevada Health District, Nevada Division of Public and Behavioral Health, or an identification issued by another state indicating a person’s desire and qualification to have life-resuscitating treatment withheld.

   B. A valid DNR Order is a written directive issued by a physician licensed in this state that life-resuscitating treatment is not to be administered to a qualified patient. The term also includes a valid Do-Not-Resuscitate order issued under the laws of another state.

   C. A valid POLST form signed by a physician that records the wishes of the patient and directs a healthcare provider regarding the provision of life-resuscitating treatment and life-sustaining treatment.

   Note: Verbal instructions from friends or family members DO NOT constitute a valid DNR/POLST.

2. In preparation for, or during an inter-facility transfer, a valid DNR Order/POLST in the qualified patient’s medical record shall be honored in accordance with this protocol.

3. If the EMS provider is presented with a DNR/POLST Order or Identification, he shall attempt to verify the validity of the Order or Identification by confirming the patient’s name, age, and condition of identification.

4. The DNR/POLST Order or Identification shall be determined INVALID if at any time the patient indicates that he/she wishes to receive life-resuscitating treatment. The EMS provider shall document the presence of the DNR/POLST Order or Identification, and how the patient indicated that he/she wanted the Order or Identification to be revoked. EMS personnel shall relay this information to any subsequent medical providers, including but not limited to, flight crews and staff at the receiving medical facility.

5. Once the DNR/POLST Order or Identification is determined to be valid and has not been revoked by the patient, the emergency care provider shall provide ONLY supportive care and withhold life-resuscitating treatment.

6. Faxed, copied or electronic versions of the DNR Identification/POLST are legal and valid.

Supportive Care:
- Suction the airway
- Administer oxygen
- Position for comfort
- Splint
- Control bleeding
- Provide pain medication (ALS only)
- Provide emotional support
- Contact hospice, home health agency, attending physician or hospital as appropriate
- Be attentive of any actions the patient may take to revoke his authorization to withhold life-resuscitating treatment
Do Not Resuscitate (DNR/POLST)(Cont.)

Withhold Life-Resuscitating Treatment:
   CPR and its components including:
   Chest compressions
   Defibrillation
   Cardioversion
   Assisted ventilation
   Airway intubation
   Administration of cardiotonic drugs

6. EMS personnel will document on the PCR the presence of the DNR/POLST Order or Identification. Documentation should include the patient’s name, and the physician’s name and identification number, which are found on the DNR/POLST Order or Identification.

7. An EMS provider who is unwilling or unable to comply with the DNR protocol shall take all reasonable measures to transfer a patient with a DNR/POLST Order or Identification to another provider or facility in which the DNR/POLST protocol may be followed.
A Patient Care Record (PCR) will be completed for each incident/patient encounter, in accordance with current EMS Regulations. A patient is any individual that, upon contact with an EMS system, has any of the following:

A. A complaint or mechanism suggestive of potential illness or injury.
B. Obvious evidence of illness or injury.
C. An individual or informed 2nd/3rd party caller requests evaluation for potential illness or injury.

PCRs shall include no less than the following information:

A. Patient’s name, address, age, and sex;
B. Date and location of call;
C. Time of dispatch, arrival at scene, departure from scene, and arrival at hospital;
D. Mechanism of injury—chief complaint;
E. Medication(s) used by patient and allergies;
F. Pertinent patient history, including current medication(s) and allergies;
G. Signs and symptoms identified during patient assessment, and changes;
H. Care and treatment given at scene and during transport;
I. Patient destination;
J. Name of attendant(s);
K. If care is provided as authorized by protocol;
L. File Attachments: The associated monitor file must be uploaded and attached to the PCR if the monitor was used for any of the following purposes:

1) Assessing and/or monitoring the cardiac rhythm;
2) Obtaining a 12-lead electrocardiogram (ECG)
3) Providing electrical therapy; cardioversion, defibrillation, and/or pacing
4) Monitoring End-Tidal Carbon Dioxide (ETCo2) levels and/or waveform of an intubated patient

M. In cases of trauma, the patient’s trauma score, TFTC status, and any injury mitigation devices shall be documented, i.e. car seats, seat belts, air bags, helmets, etc.;

N. At least one full set of vital signs;
   1) Blood pressure
   2) Heart rate
   3) Respiratory rate
   4) Temperature as indicated
   5) Oxygen saturation
   6) Reassessment after interventions, i.e. pain score after medications;
   7) Any complications or other relevant information.

Any agency that provides patient care activities prior to the arrival of the transporting agency shall provide the transporting agency with, at a minimum, a verbal report reflecting those activities. This verbal report must be documented in the transporting agency’s PCR.
Hostile Mass Casualty Incident

Active hostile incident

Assailants detained and scene immediately safe?

Yes

Evacuate patients to the triage/treatment area

While in the triage/treatment area care shall be provided as directed in the Clark County EMS System Emergency Medical Care Protocols as resources permit

Depending on patient load and acuity request additional resources as needed for transport, including the use of alternate transportation methods.

Disposition of patients will be directed through ICS taking into consideration protocol and available acute care resources

No

- If trained and properly equipped as per the Southern Nevada Fire Operations Policy 11, respond with law enforcement as a Force Protection Team to sort patients for removal to the cold zone.
- Provide treatment for immediate life threats.
- Tag patients as indicated in agency policy.

- For the purpose of this manual, an active hostile incident can be defined as any location where persons are under assault by whatever method and teams comprised of police and fire department personnel are needed to immediately enter the warm zone to provide initial treatment for life threatening injuries and to complete patient “sift and sort” procedures.

- Active hostile incident scenes represent challenges in regard to the provision of emergency care. Specific adherence to the Clark County EMS System Emergency Medical Care Protocols may not be feasible in these austere environments. Therefore, the Southern Nevada Health District authorizes brief and limited departures from protocol.

- When acting in a rescue task force licensed providers may perform needle decompression, basic airway maneuvers or apply a tourniquet to complete or partial amputations regardless of observed exsanguination.
Inter-Facility Transport of Patients By Ambulance

1. Ambulance attendants should only transfer a patient whose therapy required during the transfer lies within the ambulance attendant’s capabilities, unless capable personnel accompany the patient.
   
   A. Ambulance attendants are authorized to administer or monitor all medications listed on the official drug inventory as appropriate for their level of licensure and as per protocol.
   
   B. AEMT and Paramedic ambulance attendants are authorized to administer or monitor any crystalloid IV solution during transport.
   
   C. Arterial lines should be discontinued unless appropriate personnel from the initiating facility accompany the patient.
   
   D. Heparin locks/implantable catheters with/without reservoirs may be closed off and left in place. If they are to be used during transport, then an IV drip should be established if tolerated by the patient.
   
   E. IV pump systems should be discontinued unless capable personnel accompany the patient.
   
   F. Orogastric or nasogastric tubes may be left in place and should either be closed off or left to suction per order of the transferring physician.
   
   G. Orthopedic devices may be left in place at the ambulance attendant’s discretion as to ability to properly transport the patient with existing device(s) in place.
   
   H. Trained personnel authorized to operate the apparatus should accompany any patient requiring mechanical ventilation during transport. If the patient will require manual ventilatory assistance, then at least two persons shall be available to attend to the patient.

2. Prior to the transfer, the transferring physician is responsible for notifying the receiving physician of the following:
   
   1) Reason for transfer
   2) Patient condition
   3) Estimated time of arrival

3. The transferring physician must provide the ambulance attendants with the name of the receiving facility and receiving physician, copies of any available diagnostic tests, X-rays, medical records, copy of code status, DNR, POLST, or advanced directive paperwork as applicable, any isolation precaution information, and the EMTALA form prior to releasing the patient.

4. Any agency that provides patient care activities prior to the arrival of the transporting agency shall provide the transporting agency with, at a minimum, a verbal report reflecting those activities. This verbal report must be documented in the transporting agency’s PCR.
Pediatric patients (<18 years of age) shall be transported in accordance with the following criteria:

1. Pediatric patients (including psychiatric patients) shall be transported, based on the preference of the parent or legal guardian, to one of the following facilities:
   A. St. Rose Dominican – Siena Campus
   B. Summerlin Hospital Medical Center
   C. Sunrise Hospital & Medical Center
   D. University Medical Center

2. If the parent or legal guardian does not have a preference, the patient shall be transported to the closest of the above facilities.

3. If, in the judgment of prehospital personnel, the transport time to one of the above facilities would be detrimental to a critically ill/unstable pediatric patient, the patient should be transported to the closest Emergency Department.

4. The patient may be transported to a non-designated facility:
   A. At the request of the parent or legal guardian, and if the child is deemed stable by the EMS provider; or
   B. The incident is greater than 50 miles from the closest pediatric facility; and
   C. The receiving facility and physician are contacted and agree to accept the patient.

5. Pediatric sexual assault victims shall be transported as follows:
   A. Victims <13 years of age shall be transported to Sunrise Hospital and Medical Center.
   B. Victims 13 years of age and up to 18 years of age shall be transported to either Sunrise Hospital & Medical Center or University Medical Center.
   C. For sexual assault victims outside a 50-mile radius from the above facilities, the licensee providing emergency medical care shall transport the patient to the nearest appropriate facility.
Prehospital Death Determination

For all emergency scenes where patient needs exceed available EMS resources, initial assessment and treatment shall be in accordance with the START/SMART triage methodology.

1. Patients who appear to have expired will not be resuscitated or transported by Clark County EMS personnel if any of the following obvious signs of death are present:
   A. Body decomposition
   B. Decapitation
   C. Transection of thorax (hemicorpectomy)
   D. Incineration
   E. Functional separation from the body of the heart, brain, or lungs

OR if ALL (5) presumptive signs of death AND AT LEAST one (1) conclusive sign of death are identified.

The (5) presumptive signs of death that MUST be present are:
1) Unresponsiveness
2) Apnea
3) Pulselessness
4) Fixed, dilated pupils
5) For Non-Traumatic Arrests Asystole in at least 2 (two) leads or a no shock advised prompt from an AED

Conclusive signs of death include:
1) Dependent lividity
2) Rigor mortis

2. If there is any question regarding patient viability, to include potential hypothermia, resuscitation will be initiated.

3. Once it has been determined that the patient has expired and resuscitation will not be attempted:
   A) Immediately notify the appropriate authority;
   B) DO NOT leave a body unattended. You may be excused once a responsible person (i.e. Coroner’s investigator, police, security, or family member) is present;
   C) DO NOT remove any property from the body or the scene for any purpose;
   D) NEVER transport/move a body without permission from the Coroner’s office except for assessment or its protection.

If the body is in the public view and cannot be isolated, screened, or blocked from view, and is creating an unsafe situation with citizens/family, the body can be covered with a clean, STERILE BURN SHEET obtained from the EMS vehicle.
1. A person who is suspected to be intoxicated and has no other emergent need should be transported to an approved alcohol and drug abuse facility rather than a hospital’s emergency department *IF* the patient meets *ALL* of the following criteria:

A. Patient is able to stand with minimal assistance of one or two people.

B. Vitals as follows:
      Diastolic: 60 – 100
   2. Pulse Rate: 60 – 120
   3. Respiratory Rate: 12 – 22
   4. Blood Glucose between 60 – 250
   5. Glasgow Coma Score > 14
   6. SPO2 >94% or 90% if smoker
   7. No acute medical complications
   8. No signs of trauma
   9. No suspected head injury
   10. Approval of the physician or medical staff upon assessment prior to transport to an alternative facility. Contact with the facility needs to be routed via recorded phone patch through FAO at 702-382-9007

   All of the above parameters must be met and the patient must be clinically stable.

2. If there is *ANY* doubt about whether the person is in need of emergency medical care, the person should be transported to a receiving emergency facility.

* Approved Public Intoxication Facilities:
  WestCare
  Crossroads of Southern Nevada (CRSN)
When EMS or hospital personnel wish to have an incident involving patient care reviewed within the Clark County EMS system, the following steps shall be taken:

1. The person requesting a review of an incident should contact the designated representative of the agency/hospital involved to initiate the process. If after gathering appropriate information and discussing the incident both parties are satisfied a problem does not exist, nothing further needs to be done.

2. If either party would like to pursue an investigation of the incident, the “Southern Nevada Health District EMS Incident Report” should be completed and a copy should be forwarded to the OEMSTS.

3. Upon receipt of the “Southern Nevada Health District EMS Incident Report” OEMSTS staff will review the case, gather information from the agencies/hospitals involved, and evaluate the need for further investigation. The agency/hospital may be asked to conduct an internal investigation, involving their medical director when appropriate, and provide a summary of their findings to the OEMSTS.

4. The personnel involved in the incident may be interviewed by the EMS medical director or his designee and their agency/hospital medical director to gather additional information.

5. Upon completion of the investigation, a report will be prepared and given to the agency/hospital representatives involved. Direct communication between the agency/hospital and complainant is recommended with a brief written summary of actions taken provided to the OEMSTS.

6. A quarterly aggregate summary of the incidents reviewed by the OEMSTS will be prepared and reported at the Quality Improvement Directors and Medical Advisory Board meetings.

7. All documentation and correspondence regarding this quality improvement activity; to monitor, review, evaluate, and report on the necessity, quality, and level of care provided a patient is confidential pursuant to NRS 49.117 – NRS 49.123, NRS 49.265, NRS 450B.810 and NRS 629.061.
1. Licensed EMS personnel are not obligated to continue resuscitation efforts that have been started by other persons at the scene if the patient meets the criteria listed in the Prehospital Death Determination protocol. This includes telephone CPR initiated by Emergency Medical Dispatchers.

2. Resuscitation should be terminated/not initiated if a valid DNR/POLST or physician written order is provided without telemetry contact.

3. Resuscitation started in the field may be discontinued only by a telemetry physician order when the following conditions have been met:
   A. For medical arrest, contact closest hospital for telemetry physician order:
      The patient remains in persistent asystole or agonal rhythm after twenty (20) minutes of appropriate Paramedic resuscitation, to include:
      1) CPR
      2) Effective ventilation with 100% oxygenation
      3) Administration of appropriate ACLS medications
   B. For traumatic arrest, contact TRAUMA CENTER based on catchment for telemetry physician order:
      1) Open airway with basic life support measures
      2) Provide CPR and effective ventilations with 100% oxygenation for two (2) minutes
      3) Perform bilateral needle thoracentesis if tension pneumothorax suspected
      4) Confirm no organized rhythm or a PEA <40.
   C. The patient develops, or is found to have one of the following conclusive signs of death at any point during the resuscitative effort:
      1) Lividity
      2) Rigor mortis

4. When resuscitation has been terminated in the field, all medical interventions shall be left in place.

5. If possible, do not leave a body unattended. Once a responsible person (i.e. Coroner’s investigator, police, security, or family member) is present at the scene, you may be excused.

6. NEVER transport/move a body without permission from the Coroner’s office, except for assessment or its protection.

   If the body is in the public view and cannot be isolated, screened, or blocked from view, and is creating an unsafe situation with citizens/family, the body can be covered with a clean, STERILE BURN SHEET obtained from the EMS vehicle.
1. Patients sustaining traumatic injuries shall be transported in accordance with the Trauma Field Triage Criteria Protocol.

2. Patients sustaining burn injuries shall be transported in accordance with the Burns Protocol.

3. Pediatric patients (<18 years of age for transport purposes ONLY) shall be transported in accordance with the Pediatric Destination Protocol.

4. Patients with evidence of an acute cerebrovascular accident shall be transported in accordance with the Stroke Protocol.

5. Sexual assault victims shall be transported as follows:
   A. Victims <13 years of age shall be transported to Sunrise Hospital & Medical Center.
   B. Victims 13 years of age and up to 18 years of age shall be transported to either Sunrise Hospital & Medical Center or University Medical Center.
   C. Victims 18 years of age and older shall be transported to University Medical Center.
   D. For sexual assault victims outside a 50-mile radius from the above facilities, the licensee providing emergency medical care shall transport the patient to the nearest appropriate facility.

6. All medical patients in cardiac arrest or in whom the ability to adequately ventilate cannot be established should be transported to the closest facility.

7. Stable patients should be transported to the hospital of their choice. If the patient does not have a preference, the patient should be transported to the closest appropriate facility.

8. If a hospital declares an Internal Disaster, that facility is to be bypassed for ALL patients except patients in cardiac arrest, or in whom the ability to adequately ventilate has not been established.

9. For patients outside a 50 mile radius from protocol designated transport destinations, the licensee providing emergency medical care shall transport the patient to the nearest appropriate facility.

Remote Outpatient Emergency Department Alternate Destination Criteria

1. Patients who require a medical or psychiatric evaluation and do not have evidence of any potentially life-threatening illness or injury at the time of transport may be transported to a remote outpatient emergency department if:
   2. The patient has normal vital signs, unless accepted by the remote outpatient emergency department, telemetry contact is made, and;
   3. The patient does not meet any of the following exclusions criteria:
      A. Violent or uncooperative patients
      B. Obstetric patients > 20 weeks gestation
      C. Any patient in need of time-critical intervention that can be provided only at a hospital-based emergency department. For example, but not limited to STEMI, Stroke, or ACS.
      D. Any condition covered by another destination directive: Normal Vital Signs:
         Trauma Field Triage Criteria Heart Rate 60-100
         Stroke Protocol Respiratory Rate 10-20
         Burns Protocol Systolic BP 100-180
         Pediatric Destination Protocol Diastolic BP 60-110
         Sexual Assault Victims Room air pulse oximetry >94%
         Cardiac Arrest Alert and oriented X4

4. Alternate transportation and destination decisions should be consistent with medical necessity and with consideration for patient preference when the patient’s condition allows.
A licensee providing emergency medical care to a patient at the scene of an injury shall use the following procedures to identify and care for patients with traumas:

1. **Step 1 – Measure vital signs and level of consciousness.** If the patient’s:
   - A. Glasgow Coma Scale is 13 or less;
   - B. Systolic blood pressure is less than 90 mm Hg; or
   - C. Respiratory rate is less than 10 or greater than 29 breaths per minute (less than 20 in infant aged less than 1 year), or is in need of ventilatory support

   the adult patient **MUST** be transported to a Level 1 or 2 center for the treatment of trauma in accordance with the catchment area designated. The pediatric patient **MUST** be transported to a pediatric center for the treatment of trauma.

2. **Step 2 – Assess anatomy of injury.** If the patient has:
   - A. Penetrating injuries to head, neck, torso, or extremities proximal to elbow or knee;
   - B. Chest wall instability or deformity (e.g. flail chest);
   - C. Two or more proximal long-bone fractures;
   - D. Crushed, degloved, mangled, or pulseless extremity;
   - E. Amputation proximal to wrist or ankle;
   - F. Pelvis fractures;
   - G. Open or depressed skull fractures; or
   - H. Paralysis

   the adult patient **MUST** be transported to a Level 1 or 2 center for the treatment of trauma in accordance with the catchment area designated. The pediatric patient **MUST** be transported to a pediatric center for the treatment of trauma.

3. **Step 3 – Assess mechanism of injury and evidence of high-energy impact, which may include:**
   - A. Falls
     1) Adults: greater than 20 feet (one story is equal to 10 feet)
     2) Children: greater than 10 feet or two times the height of the child
   - B. High-risk auto crash
     1) Motor vehicle was traveling at a speed of at least 40 miles per hour immediately before the collision occurred;
     2) Intrusion, including roof: greater than 12 inches occupant site; greater than 18 inches any site;
     3) Ejection (partial or complete) from automobile;
     4) Motor vehicle rolled over with unrestrained occupant(s);
     5) Death in same passenger compartment
   - C. Motorcycle crash greater than 20 mph
   - D. Auto vs pedestrian/bicyclist thrown, run over, or with significant (greater than 20 mph) impact

   The patient **MUST** be transported to a Level 1, 2, or 3 center for the treatment of trauma in accordance with the catchment area designated. For patients who are injured outside a 50-mile radius from a trauma center, the licensee providing emergency medical care shall call and consider transport to the nearest receiving facility.
4. Step 4 – Assess special patients
   A. Older adults
      1) Risk of injury/death increases after age 55 years
      2) SBP less than 110 mm Hg might represent shock after age 65 years
      3) Low impact mechanisms (e.g. ground level falls) might result in severe injury
   B. Children should be triaged preferentially to a trauma center.
   C. Anticoagulants and bleeding disorders: Patients with head injury are at high risk for rapid deterioration.
   D. Burns
      1) Without other trauma mechanisms: transport in accordance with the Burns protocol
      2) With trauma mechanism: follow appropriate catchment guidelines for trauma. Trauma patients with burns falling into St Rose Siena catchment area will be transported to Sunrise Hospital.
   E. Pregnancy greater than 20 weeks
   F. EMS provider judgment

The patient MUST be transported to a Level 1, 2, or 3 center for the treatment of trauma in accordance with the catchment area designated. For patients who are injured outside a 50-mile radius from a trauma center, the licensee providing emergency medical care shall call and consider transport to the nearest receiving facility.

The person licensed to provide emergency medical care at the scene of an injury shall transport a patient to a designated center for the treatment of trauma based on the following guidelines:

St. Rose Dominican Hospital - Siena Campus (Level 3 Trauma Center) Catchment Area
All trauma calls that meet Step 3 or in the provider’s judgment meet Step 4 of the Trauma Field Triage Criteria Protocol and occur within the City of Henderson or the geographical area bordered by Interstate 15 to the west and Sunset road to the north, and the county line to the east, are to be transported to St. Rose Dominican Hospital – Siena Campus and the medical directions for the treatment of the patient must originate at that center;

Sunrise Hospital & Medical Center (Level 2 Trauma Center) Catchment Area
All adult trauma calls and pediatric Step 3 trauma calls that meet the Trauma Field Triage Criteria Protocol and occur within the geographical area bordered by Paradise Road to the west, Sahara Avenue to the north, Sunset Road to the south, and the county line to the east, are to be transported to Sunrise Hospital & Medical Center and the medical directions for the treatment of the patient must originate at that center;

In addition, adult trauma calls that meet Step 1 or 2 of the Trauma Field Triage Criteria Protocol and occur within the St. Rose Dominican Hospital – Siena Campus Catchment Area, City of Henderson, or the geographical area bordered by Paradise Road to the west continuing along that portion where it becomes Maryland Parkway, Sunset Road to the north, and the county line to the east, are to be transported to Sunrise Hospital & Medical Center and the medical directions for the treatment of the patient must originate at that center.

University Medical Center (Level 1 Trauma Center and Pediatric Level 2 Trauma Center) Catchment Area
All trauma calls that meet the Trauma Field Triage Criteria and occur within any other area of Clark County are to be transported to University Medical Center/Trauma and the medical directions for the treatment of the patient must originate at that center.

All pediatric Step 1 and Step 2 trauma calls that occur within Clark County are to be transported to University Medical Center/Trauma and medical directions for the treatment of the patient must originate at that center.

In addition, adult trauma calls that meet Step 1 or 2 of the Trauma Field Triage Criteria Protocol and occur in the geographical area bordered by Paradise road to the east, Sunset Road to the north, Interstate 15 to the west, and the county line to the south, are to be transported to University Medical Center/Trauma and the medical directions for the treatment of the patient must originate at that center.
All trauma calls that meet the Trauma Field Triage Criteria Protocol, regardless of location, that are transported by air ambulance are to be transported to University Medical Center/Trauma and the medical directions for the treatment of the patient must originate at that center.

EXCEPTIONS:

1. Nothing contained within these guidelines precludes transport to any trauma facility if, in the provider’s judgment, time to transport to the designated center would be unduly prolonged due to traffic and/or weather conditions and might jeopardize the patient’s condition.

2. Additionally, nothing contained within these guidelines precludes transport to the closest facility if, in the provider’s judgment, an ability to adequately ventilate the patient might result in increased patient mortality.
Waiting Room Criteria

Upon arrival in the emergency department, if transfer of care has not occurred in accordance with NRS 450B.790, any patient, excluding patients placed on a legal psychiatric hold, meeting ALL the following criteria may be placed in the hospital waiting room or other appropriate location:

1. Normal vital signs
   A. Heart rate 60 - 100
   B. Respiratory rate 10 - 20
   C. Systolic BP 100 - 180
   D. Diastolic BP 60 - 110
   E. Room air pulse oximetry >94%
   F. Alert and oriented x 4

2. Did not receive any parenteral medications during EMS transport except a single dose of analgesia and/or an anti-emetic.

3. In the judgment of the Paramedic, does not require continuous cardiac monitoring. Note: Any ECG monitoring initiated by a transferring facility may not be discontinued by EMS personnel.

4. Can maintain a sitting position without adverse impact on their medical condition.

5. Is left with a verbal report to hospital personnel.
PROCEDURES

PROTOCOLS
## Indications:
This procedure may be performed on any patient with potential for spinal injury based upon the following (NEXUS) criteria:

- A. Midline cervical spinal tenderness
- B. Focal neurologic deficit
- C. Altered mental status
- D. Evidence of drug and/or alcohol intoxication
- E. Any painful, distracting injury

## Contraindications:
Cervical stabilization is NOT performed in the following conditions:

- A. Penetrating trauma to the head and/or neck and no evidence of spinal injury
- B. Injuries where placement of the collar might compromise patient assessment, airway management, ventilation and/or hemorrhage control
- C. Patients in cardiac arrest

## Key Procedural Considerations:

A. If (A-E) above are ALL NEGATIVE, cervical stabilization is not required.
B. If required, cervical stabilization is the placement of an approved, properly-sized cervical collar before the patient is moved.
C. Tape, head straps, wedges, and head and/or neck support devices are not recommended.
D. Patients found in motor vehicles should be asked if they are able to exit the motor vehicle on their own. If so, they should be assisted to a soft stretcher and secured for transport. Patients unable to exit the vehicle on their own accord should be removed by the appropriate extrication method.
E. Once on the stretcher, the patient may be moved to a semi-Fowler’s or high-Fowler’s position for comfort.
F. If a backboard is used for extrication or movement, the patient should be immediately moved to a soft mattress, if possible.
G. In special situations, alternate stabilization devices (e.g. vacuum mattress, KED, etc. may be used as indicated).
H. Pediatric patients may be stabilized in an approved car seat or with a commercial pediatric stabilization device.
Continuous Positive Airway Pressure (CPAP)

LEVEL: Paramedic

Indications:
This procedure may be performed on any patient 18 years old or older in CHF, Respiratory Distress with Bronchospasm, and pneumonia, who has TWO of the following:

A. Retractions or accessory muscle use
B. Respiratory rate >25 per minute
C. SpO₂ ≤94%

Contraindications:
A. Apnea
B. Vomiting or active GI bleed
C. Major trauma/pneumothorax
D. Altered Mental Status

Key procedural considerations:
A. Assess patient and document VS, SpO₂ and ETCO₂ prior to applying oxygen.
B. Select the appropriate size face mask for the patient.
C. Inform patient about procedure process.
D. Gradually increase the flow rate, slowly reaching the desired CPAP pressure.
E. Secure face mask onto patient face using the head harness.
F. Check the mask and tubing for leaks.
G. Reassess patient and document every five minutes.
H. If patient develops any of the contraindications or requires definitive airway control, discontinue CPAP and provide necessary airway control.
Indications:
This procedure may be performed on any patient experiencing:
A. Ventricular fibrillation
B. Pulseless ventricular tachycardia
C. Torsades de Pointes

Contraindications: None

Key procedural considerations:
A. The initial and subsequent attempts shall be at the energy level(s) suggested by the device manufacturer and/or the agency’s medical director.
B. Defibrillation should be immediately provided in an arrest WITNESSED by EMS personnel. In an arrest that is UNWITNESSED by EMS personnel, two minutes of CPR should be provided prior to defibrillation.
C. Patients with automatic implantable cardioverter-defibrillators (AICD) will need external defibrillation if the AICD is ineffective.
D. If defibrillation is needed on a patient with a permanent implanted pacemaker, the defibrillator paddles or self adhesive electrodes should be placed at least one inch from the pulse generator of the pacemaker.

Initial attempt at pediatric defibrillation shall be at 2 J/kg. If unsuccessful, defibrillation should be attempted at 4 J/kg and continue at 4 J/kg until conversion occurs. Adult paddles/pads may be used in children weighing more than 15 kg.
**Indications:**

This procedure may be performed on any patient experiencing:

- A. Ventricular tachycardia with inadequate perfusion
- B. Supraventricular tachycardia with inadequate perfusion
- C. Ventricular tachycardia with adequate perfusion, but refractory to drug therapy

**Contraindications:** None

The patient **MUST** be on a cardiac monitor and **SHOULD** have Vascular Access

**Adjunctive therapy:**

- In the conscious patient with a systolic blood pressure of >90mmHg consider:
  - **Sedation:** Etomidate 0.15 mg/kg IV/IO or;
    - Midazolam 0.1 mg/kg IN/IM/IV/IO. May repeat every five minutes at 0.05 mg/kg IN/IM/IV/IO or;
    - Diazepam 5 mg IV/IO. May repeat after five minutes with physician order.
  - **Analgesia:** Morphine Sulfate up to 0.1 mg/kg slow IV/IO to a maximum single dose of 10 mg. May repeat every 10 minutes until pain is relieved or respiratory/mental status depression occurs or;
    - Fentanyl up to 1 mcg/kg IN/IM/IV/IO to a maximum single dose of 100 mcg. May repeat dose after 10 minutes with physician order or;
    - Hydromorphone up to 1 mg IV/IO. May repeat dose after ten minutes with physician order or;
    - Ketamine 0.2 mg/kg IM/IV/IN/IO no repeat dose.

**Contraindications:** None

**Key procedural considerations:**

- A. Biphasic device: The initial and subsequent attempts shall be at the energy level(s) suggested by the device manufacturer and/or the agency’s medical director.
- B. Monophasic device:
  1. Ventricular dysrhythmias: 100 J escalating to 200, 300, and 360
  2. Supraventricular dysrhythmias: 50 J with subsequent attempts at 100 J

Initial attempt at pediatric cardioversion shall be at 0.5 J/kg. If unsuccessful, cardioversion should be attempted at 2 J/kg. Adult paddle/pads may be used in children weighing more than 15 kg.
Indications:
This procedure may be performed on any patient experiencing:
A. Hemodynamically unstable bradycardia
B. Unstable clinical condition that is likely because of bradycardia
C. For pacing readiness (i.e. standby mode) in the setting of MI with bradycardia, second degree type II AV block, third degree AV block, new left or right alternating BBB or bifascicular block
D. Overdrive pacing of tachycardias refractory to drug therapy or electrical cardioversion

Contraindications: None

Adjunctive therapy:
In the conscious patient with a systolic blood pressure of >90mmHg consider:
Sedation: Etomidate 0.15 mg/kg IV/IO or;
Midazolam 0.1 mg/kg IN/IM/IV/IO. May repeat every five minutes at 0.05 mg/kg IN/IM/IV/IO or;
Diazepam 5 mg IV/IO. May repeat after five minutes with physician order.
Analgesia: Morphine Sulfate up to 0.1 mg/kg slow IV/IO to a maximum single dose of 10 mg. May repeat every 10 minutes until pain is relieved or respiratory/mental status depression occurs or;
Fentanyl up to 1 mcg/kg IN/IM/IV/IO to a maximum single dose of 100 mcg. May repeat dose after 10 minutes with physician order or;
Hydromorphone up to 1 mg IV/IO. May repeat dose after ten minutes with physician order or;
Ketamine 0.2 mg/kg IM/IV/IN/IO no repeat dose.

Key procedural considerations:
A. Apply pacing pads, begin pacing at a rate of 60 beats per minute at the lowest available current.
B. Increase current by 20 milliamp increments until electrical capture.
C. In the event of electrical capture and no pulses, continue pacing and CPR.

Pediatric pacing is by telemetry physician order only
# Endotracheal Intubation

**LEVEL: Paramedic**

1. All intubations **MUST** have initial, en route, and at transfer of care End-Tidal CO\textsubscript{2} detection/capnography performed and recorded on the PCR.
2. All intubation attempts **MUST** be documented on the PCR.

## Indications:

This procedure may be performed on any patient in whom attempts at basic airway and ventilatory support are unsuccessful **AND** who has at least one of the following:

- A. Hypoxia
- B. Respiratory arrest/failure
- C. Inability to maintain airway patency

## Contraindications:

**Absolute Contraindications:** None

**Relative Contraindications:**

A. Presence of gag reflex
B. Suspected narcotic overdose/hypoglycemia prior to administration or Naloxone/Glucose 50%

## Adjunctive Therapy:

- If patient is 12 years of age or greater, administer Etomidate 0.3 mg/kg IV/IO for induction.
- If patient is less than 12 years of age, administer Midazolam 0.1 mg/kg IV/IN/IO titrated to effect. Maximum single dose: 5 mg. Must be given slowly over a period of 3-5 minutes. Additional pediatric doses by telemetry physician order only.

   Ketamine can be used for all patients for induction: 2 mg/kg IV/IO or 4 mg/kg IM.

**Maintain patient sedation.**

A. Midazolam 0.1 mg/kg IV/IN may repeat every 5 minutes at 0.05mg/KG IV/IN/IM

OR

B. Ketamine 2mg/KG IV or 4mg/kg IM; contact medical control for additional doses

## Key procedural considerations:

A. Position head properly.
B. Insert blade while displacing tongue and elevate mandible with laryngoscope.
C. Introduce ET tube and advance to proper depth.
D. Inflate cuff to proper pressure and disconnect syringe.
E. Ventilate patient and confirm proper placement.
F. Verify proper tube placement by secondary confirmation such as capnography or colorimetric device.
G. Secure device or confirm that the device remains properly secured.

---

Endotracheal Intubation (Revised and approved by MAB 3-06-2019)
Nasotracheal Intubation:

Contraindications:

A. Apnea or near-apnea
B. Suspected basilar skull, nasal, or midface fractures
C. Coumadin anticoagulation therapy or hemostatic disorders
D. Upper neck hematomas
E. Should NOT be attempted in children

Adjunctive Therapy:

Prep the nostrils with:

1) Phenylephrine 2-3 drops (or 1-2 sprays in each nostril), or Oxymetazoline 2 sprays in each nostril.

and

2) Lidocaine 2% lubricant.

Key procedural considerations:

A. Position patient semi-Fowler, sitting or supine.
B. Insert lubricated ET tube into dilated nostril and advance straight back (posteriorly).
C. Listen to end ET tube for sounds of patient’s breathing.
D. During inhalation, smoothly advance tube through glottic opening.
E. Inflate cuff to proper pressure and disconnect syringe.
F. Verify proper tube placement by secondary confirmation such as capnography or colorimetric device.
G. Secure device or confirm that the device remains properly secured.
Indications:

This procedure may be performed on any patient in which attempts at basic airway and ventilatory support are unsuccessful AND who has at least one of the following:

A. Hypoxia
B. Respiratory arrest/failure
C. Obtundation
D. Failed endotracheal intubation

Contraindications:

A. Gag reflex
B. History of esophageal trauma, or known esophageal disease
C. Recent ingestion of a caustic substance
D. Tracheostomy or laryngectomy
E. Suspected foreign body obstruction

Key procedural considerations:

A. Pre-oxygenate the patient.
B. Position the patient’s head in a neutral or slightly flexed position if no suspected spinal injury (if a spine injury is suspected, maintain a neutral, in-line head position).
C. Perform a tongue-jaw lift.
D. Insert device to proper depth. NEVER force. If device does not advance, readjust the insertion.
E. Secure device in the patient (inflate cuff(s) with proper volume(s) and immediately remove syringe).
F. Ventilate patient and confirm proper ventilation (correct lumen and proper insertion depth) by auscultation bilaterally over lungs and over epigastrium.
G. Adjust ventilation as necessary (ventilate through additional lumen or slightly withdraw tube until ventilation is optimized).
H. Verify proper tube placement by secondary confirmation such as capnography or colorimetric device.
I. Secure device or confirm that the device remains properly secured.

Check and prepare the extraglottic airway device prior to insertion.
**Inclusion Criteria:**

A. Coded and dispatched using MPDS as an Alpha or Omega category  
B. Patient age $\geq 18 \leq 65$  
C. Full assessment performed by first response  
D. Patient deemed to have decision making capacity  
E. Normal vital signs including $\text{SPO}_2$  
F. Patient has a phone, ability and willingness to call 9-1-1 if their condition worsens  
G. In the opinion of the AEMT/paramedic and the patient it is safe to release until an ambulance arrives

**Exclusion Criteria:**

A. Abnormal vital signs including $\text{SPO}_2$  
B. Pregnancy  
C. Any high risk complaints/symptoms  
   a. Chest pain  
   b. Signs/symptoms of possible stroke  
   c. Allergic reaction  
   d. Shortness of breath  
   e. Abdominal pain/flank pain above umbilicus age $>35$  
   f. Syncope, near syncope, dizziness  
   g. Seizure  
   h. History or sign of head trauma  
   i. Active bleeding  
   j. Threat to self or others  
   k. Overdose or ingestional error  
   l. Patients meets Trauma Field Triage Criteria  

D. No SNHD EMS Protocol indication for obtaining EKG or placing the patient on a cardiac monitor

*EMS patient care record must be completed within four hours of clearing the call*

*The Field Response Low-Risk Alpha Evaluate and Release Form must be completed and a copy left with the patient for inclusion in the secondary responder’s patient care report*
Hemorrhage:
This procedure may be performed on any patient that has bleeding from an extremity, junctional hemorrhage or torso hemorrhage.

Extremity Hemorrhage — Tourniquet Application:
A. Apply tourniquet proximal to the bleeding site.
B. Absolute contraindication: Bleeding has stopped
C. If bleeding is not controlled, consider additional tightening or applying a second tourniquet proximal side by side to the first.
D. Wound packing does not preclude you from placing a tourniquet.

Junctional Hemorrhage — Wound Packing:
A. Junctional Hemorrhage Defined: hemorrhage occurring at the junction of an extremity with the torso, and/or the base of the neck.
B. Use direct pressure and an appropriate pressure dressing with deep wound packing (plain gauze or, if available, hemostatic gauze).
C. Absolute Contraindication: Hemostatic gauze use on hemorrhaging abdominal wounds.
Indications:
This procedure may be performed on any patient that requires the administration of a medication.

Key procedural considerations (GENERAL):
A. Inquire about allergies and previous medication reactions
B. Check and recheck medication
C. Solution clarity and expiration date
D. Right drug
   Right patient
   Right dose
   Right time
   Right route
   Right documentation
E. Dispose of syringe and other material in proper container

Intravenous and Intraosseous Bolus Medications
Key procedural considerations:
A. Identify and cleanse injection site closest to the patient
B. Administer correct dose at proper push rate
C. Turn IV on and adjust drip rate to TKO/KVO

Intramuscular and Subcutaneous Drug Administration
Key procedural considerations:
A. Needle should be 20 gauge or smaller
B. Locate administration site
   Deltoid muscle
   Vastus lateralis (lateral thigh) muscle
   Ventrogluteal or dorsogluteal muscles (buttocks)

   IM
   Pull skin tight
   Insert needle at a 90° angle to the skin
   Advance into muscle layer

   SQ
   Pinch to lift skin slightly
   Insert needle at a 45° angle to the skin
   Advance into subcutaneous layer
Indications:
This procedure may be performed on any patient that requires the administration of a medication.

Key procedural considerations (GENERAL):
A. Inquire about allergies and previous medication reactions
B. Check and recheck medication
C. Solution clarity and expiration date
D. Right drug
   - Right patient
   - Right dose
   - Right time
   - Right route
   - Right documentation
E. Dispose of syringe and other material in proper container
Indications:
This procedure may be performed on any patient with:
A. Total airway obstruction by any BLS or ALS procedures, OR
B. Inability to be adequately ventilate with any provider level emergency care procedures prior to the attempt.

Contraindications:
A. Inability to identify landmarks (cricothyroid membrane)
B. Underlying anatomical abnormality (tumor)
C. Tracheal transection
D. Acute laryngeal disease due to infection or trauma

Key procedural considerations:
*Please follow Manufacturer’s Instructions*
A. Position patient supine (if possible), hyperextending the head.
B. Locate cricothyroid membrane and clean site thoroughly.
C. Stabilize cricoid and thyroid cartilages with one hand.
D. Puncture needle/catheter at a 90° angle and then change insertion angle to 45° up to the stopper; gently aspirate with attached syringe.
E. When syringe is able to aspirate air, stop advancing needle.
F. Remove the stopper from the cannula and advance the cannula only until the phlange is flush with the patient’s neck. Remove the metal needle from the cannula. Remove the syringe.
G. Secure the cannula with the neck strap.
H. Apply connecting tube and attach to BVM and ventilate patient.

- Pediatric needle cricothyroidotomy is by Telemetry Physician order only.
- You MUST use a 14 gauge over-the-needle catheter attached to a 10 cc syringe or commercial cricothyroidotomy device.
Needle Thoracentesis

**Indications:**
This procedure may be performed on any patient who has evidence of a tension pneumothorax, demonstrated by the presence of:

Progressive respiratory distress and/or increased resistance to bagging, **AND** unilateral diminished/absent breath sounds, associated with:

A. Tracheal deviation, or
B. Jugular venous distension, or
C. Signs of shock, low BP with chest trauma present

**Contraindications:** None

**Needle Thoracentesis is permitted in pediatric patients.**

**Key procedural considerations:**

A. Primary site is the 2\(^{nd}\) intercostal space mid-clavicular line of the affected side.
B. Alternate location is the 4\(^{th}\) - 5\(^{th}\) intercostal space in the mid-axillary line of the affected side.
C. Use a site specific, appropriate length needle to decompress the chest.
D. Prep site with iodine and/or alcohol.
E. Place tip of needle on top of appropriate rib and insert over top of rib into intercostal space.
F. Advance catheter and remove needle.
G. Secure catheter and consider attaching a flutter valve assembly.
Indications:
This procedure may be performed on any patient that has a Tracheostomy Tube and who has:
A. Hypoxia
B. Respiratory arrest/failure
C. Obtundation
D. Secretions unable to be cleared by suctioning

Contraindications: None

Key procedural considerations:
A. If the patient or family has a replacement tube available, it may be used. If a replacement tube is not available, an endotracheal tube of a similar outer diameter may be used.
B. Premoisten the tube with water soluble lubricant.
C. Extend the neck and, if necessary, place a roll between the patient’s shoulder blades to aid in visualizing the stoma.
D. If the tube cannot be placed easily, withdraw the tube; administer oxygen and positive pressure ventilation. NEVER force the tube.
E. Secure the device to the patient.
F. If the tube cannot be easily placed, a suction catheter may be used as a guide.
**Indications:**
This procedure may be performed on any patient with an isolated midshaft femur fracture.

**Contraindications:**
A. Pelvic fracture or instability
B. Knee, lower leg, or ankle instability

**Key procedural considerations:**
A. Assess motor, sensory, and circulatory function in the involved extremity.
B. Apply traction splint per the manufacturer’s guidelines.
C. Initiate mechanical traction to match manual traction.
D. Reassess motor, sensory, and circulatory function in the involved extremity.
E. Exercise care when applying traction not to reintroduce bone ends into the body.
Vagal Maneuvers

LEVEL: Paramedic

The patient *MUST* be attached to a cardiac monitor and *MUST* have vascular access prior to performing the procedure.

Indications:
This procedure may be performed on any patient who is experiencing Supraventricular Tachycardia with adequate perfusion.

Contraindications:
None

Key procedural considerations:
A. Approved methods include:
   1. Valsalva maneuver
   2. Head-down tilt with deep inspiration
   3. Activation of the “diving reflex” by facial immersion in ice water (unless ischemic heart disease is present)
   4. Carotid massage (only on patients under 40 years of age)
B. In infants and young children, the most effective vagal maneuver is the application of ice to the face. IV access is not mandatory prior to vagal maneuvers in children.
Indications for Peripheral Vascular Access:
This procedure may be performed on any patient whenever there is a potential need for:
A. Intravenous drug administration
B. Need to administer IV fluids for volume expansion

Contraindications: None

Key procedural considerations:
A. Saline locks may be used when appropriate and flushed with a 3 cc bolus of NS as needed.
B. Extension tubing should be used on all IV lines.

Indications for Intraosseous Access (Paramedic for Adult and Peds, AEMT for Adult Only)
Critically ill or injured patient who requires IV drugs/ fluids and in whom a peripheral line cannot be immediately established.

Contraindications:
A. Placement in, or distal to a fractured bone.
B. Previous significant orthopedic procedure at the site; prosthetic limb or joint; IO catheter use in past 48 hours of the target bone.
C. Infection at the area of insertion.
D. Absence of adequate anatomical landmarks.

Paramedic may administer lidocaine 1% or 2% preservative-free for anesthetic in a patient responsive to pain.
1) Prime IO extension tubing set with lidocaine (EZ IO, EZ Connect priming volume is 1ml)
2) Slowly infuse lidocaine 40mg (PEDIATRIC dose: 0.5 mg/kg not to exceed 40 mg) IO over 120 seconds.
3) Allow lidocaine to dwell in IO space for 60 seconds.
4) Flush IO with 5-10 ml normal saline.
5) Slowly administer an additional dose of lidocaine IO (20mg) over 60 seconds.
6) Consider systemic pain medication for patients not responding to IO lidocaine.

Key procedural considerations: Only 1 (one) attempt is permitted per extremity.

Indications for use of Previously Established Central Line Access:
This procedure may be performed on any critically ill or injured patient who requires IV drugs or IV fluids AND in whom a peripheral line cannot be established.

Contraindications: Inability to freely aspirate blood out of the catheter.

Key procedural considerations: Central line access (Implantable Ports, Port-A-Caths, Medports)
A. May only be used if the device has already been accessed and IV fluid set-up has been established and running.
B. These devices require special needles (non-coring type) for access. The device may be damaged if standard jumper (conventional) needles are used to access the ports.
ACETYLSALICYLIC ACID (Aspirin)

CLASS: Nonsteroidal anti-inflammatory (NSAID)

ACTION: Platelet inhibition

DOSE:

\text{Overdose or ingestional error} & \text{Abdominal pain/flank pain above the Umbilicus if >35 years of age} & \\
\hline
\end{tabular}  
\text{Inclusion Criteria:}  
Call coded and dispatched using MPDS, Alpha or Omega category  
Patient between 18 and 65 years of age  
Patient has decision making capacity  
Patient has a phone to call 9-1-1 if their condition worsens  
We have assessed and examined you and have determined your condition as NOT THREATENING TO LIFE/LIMB. With your permission, we will return to service so we may be available in the case of another emergency. An ambulance is continuing to respond. If your condition worsens in any way, call 9-1-1.  
I consent to waiting for the ambulance and understand that I can call 9-1-1 if I get worse in any way.  

Patient signature  Provider signature
SAMPLE
RELEASE OF MEDICAL ASSISTANCE

1. I (or my guardian) have been informed of the reason I should go to the hospital for further emergency care.

2. I (or my guardian) have been informed that only an initial evaluation has been rendered to me and have been advised that I seek the advice of a physician as soon as possible.

3. I (or my guardian) have been informed of the potential consequences and/or complications that may result in my (or my guardian’s) refusal to go to the hospital for further emergency care.

4. I (or my guardian), the undersigned, have been advised that emergency medical care on my/the patient’s behalf is necessary, and that refusal of recommended care and transport to a hospital facility may result in death, or imperil my/the patient’s health by increasing the opportunity for consequences or complications. Nevertheless, and understanding all of the above, I (or my guardian), refuse to:

   □ accept emergency medical care
   □ accept transport to a hospital facility
   □ accept transport to _____________ Hospital as directed by Southern Nevada EMS protocols, but request transport to _____________ Hospital; and

   assume all risks and consequences resulting from my (or my guardian’s) decision, and release Clark County provider agencies, and all personnel directly or indirectly involved in my care from any and all liability resulting from my (or my guardian’s) refusal. I have had the opportunity to ask all of the questions I feel necessary to provide this informed refusal.

5. The reason for this refusal is as follows: (to be completed by patient/guardian)

Describe proposed plan of treatment

Agrees?

Yes → Initiate Care

No →

EMS Personnel suspect compromise in judgment in presence of life/limb threatening injury/illness?

Yes → Initiate care under implied consent

No →

Patient is an adult or an emancipated minor and has decision-making capacity?

Yes → Explain & document specific risks of refusal

No → Enlist help of others as appropriate (PD, friends, family, medical control)

Guardian available? (Consider cellular or dispatch assisted contact)

No →

Rational teen in low risk situation?

Yes → Accept Waiver

No → Initiate care under implied consent

Patient willing to sign waiver?

Yes → Document efforts and patient’s refusal to sign

No →

Note:

1. For all patients refusing transport who meet Trauma Field Triage Criteria protocol, contact a trauma center.
2. EMS personnel may make telemetry contact for further guidance at any time.
The following is the formulary used by EMS agencies in Clark County. Licensed EMS providers working in the EMS System for a permitted agency are authorized, within their level of certification and training, to administer medications as directed by the written treatment protocols.

Appendix E

Mass Casualty Incident

Licensed EMS providers who are on duty for a permitted agency may operate within their scope of practice at a receiving facility during a Mass Casualty Incident if that incident is classified as a Level 3, Level 2, Level 1, Extreme MCI or Hostile MCI as defined by the Fire Alarm Office Standard Operating Procedure, M-1 dated 5/09/2016 if requested by an authorized agent of the receiving facility. Further, if the licensed EMS provider is requested through the Incident Commander or Designee to assist with Mass Casualty Incident (as defined above) related patient surge at a hospital to provide triage expertise or act as a liaison with the EMS system they may do so with consideration being made to EMS system needs, status and relevant law.

Revised and approved by MAB 12-05-2018
