hardware template.

Note to Architect: Proper installation is essential to the proper performance of acoustical door and frame assemblies.

It shall be the responsibility of the General Contractor to perform the following:

A. Verification of conditions:

1. Prior to installation, check and correct frames for size, swing, squareness, alignment, twist and 2. Verify openings are in accordance with approved shop drawings. B. Installer's examination

1. Have installer of this section examine conditions under which construction activities of this section are to be performed, then submit written notification if such conditions are unacceptable. 2. Transmit two copies of installer's report to Architect within 24 hours of receipt. 3. Beginning construction activities of this section before unacceptable conditions have been

corrected is prohibited. 4. Beginning construction activities of this section indicates installer's acceptance of conditions. C. Solidly grout fill frames where so indicated on the drawings or the approved submittals, eliminating all voids. The flanking path normally found behind the frame must be packed with either 6-12 lb rock wool insulation or grout filled to assure minimum sound transmission.

3.2 PREPARATION A. Remove steel spreaders from welded frames prior to installation; use of spreaders for installation purposes not permitted. 3.3 INSTALLATION

2. Alignment: Plus or minus 1/16 inch measured on jambs on a horizontal line parallel to the plane of the wall. 3. Twist: Plus or minus 1/16 inch measured at face corners of jambs on parallel lines perpendicular to the plane of the wall.

4. Plumb: Plus or minus 1/16 inch measured on the jamb at the floor. NOTE ** The above tolerances provide a reasonable guideline for proper installation of hollow metal

frames. However, it should be noted that the cumulative effect of the tolerances at their maximum levels will result in sufficient misalignment to prevent the door from functioning properly. Care should be taken to keep each of these tolerances as close to zero as possible. 3.4 FIELD QUALITY CONTROL A. Engage and pay for the field services of manufacturer's authorized representative to: . Inspect completed installation of door and frame assemblies.

2. Test all components through a minimum of ten complete cycles of operation. 3. Verify each component is correctly installed. 4. Direct installer in adjusting components for correct operation. 5. Colors: As indicated in a color schedule

2.3 SOURCE QUALITY CONTROL A. Testing of Paint Materials: Owner reserves the right to invoke the following procedure: 1. Owner will engage the services of a qualified testing agency to sample paint materials. Contractor will be notified in advance and may be present when samples are taken. If paint materials have already been delivered to Project site, samples may be taken at Project site. Samples will be

identified, sealed, and certified by testing agency. 2. Testing agency will perform tests for compliance with product requirements. 3. Owner may direct Contractor to stop applying coatings if test results show materials being used do not comply with product requirements. Contractor shall remove noncomplying paint materials from Project site, pay for testing, and repaint surfaces painted with rejected materials. Contractor will be required to remove rejected materials from previously painted surfaces if, on repainting with

complying materials, the two paints are incompatible.

PART 3 EXECUTION 3.1 EXAMINATION A. Examine substrates and conditions, with Applicator present, for compliance with requirements for maximum moisture content and other conditions affecting performance of the Work. Verify suitability of substrates, including surface conditions and compatibility with existing finishes and primers. Where acceptability of substrate conditions is in question, apply samples and perform in-situ testing to verify compatibility, adhesion, and film integrity of new paint application.

1. Report, in writing, conditions that may affect application, appearance, or performance of paint.B. Substrate 1. Maximum Moisture Content of Substrates: When measured with an electronic moisture meter as

follows: a. Concrete: 12 percent. b. Masonry (Clay and CMU): 12 percent.

e. Plaster: 12 percent. 2. Gypsum Board Substrates: Verify that finishing compound is sanded smooth. 3. Plaster Substrates: Verify that plaster is fully cured. 4. Spray-Textured Ceiling Substrates: Verify that surfaces are dry.

3.2 PREPARATION A. Comply with manufacturer's written instructions and recommendations in "MPI Manual" applicable to substrates indicated. B. Remove hardware, covers, plates, and similar items already in place that are removable and are not to be painted. If removal is impractical or impossible because of size or weight of item, provide surface-applied

C. Proceed with coating application only after unsatisfactory conditions have been corrected; application of

1. After completing painting operations, use workers skilled in the trades involved to reinstall items that were removed. Remove surface-applied protection if any. C. Clean substrates of substances that could impair bond of paints, including dust, dirt, oil, grease, and

1. Remove incompatible primers and reprime substrate with compatible primers or apply tie coat as required to produce paint systems indicated. D. Concrete Substrates: Remove release agents, curing compounds, efflorescence, and chalk. Do not paint surfaces if moisture content or alkalinity of surfaces to be painted exceeds that permitted in manufacturer's written instructions.

1. Concrete Floors: Remove oil, dust, grease, dirt, and other foreign materials. Comply with SSPC-SP-13/NACE 6 or ICRI 03732. E. Masonry Substrates: Remove efflorescence and chalk. Do not paint surfaces if moisture content or alkalinity of surfaces or mortar joints exceed that permitted in manufacturer's written instructions.

F. Steel Substrates: Remove rust, loose mill scale, and shop primer, if any. Clean using methods recommended in writing by paint manufacturer. G. Galvanized-Metal Substrates: Remove grease and oil residue from galvanized sheet metal fabricated from coil stock by mechanical methods to produce clean, lightly etched surfaces that promote adhesion of subsequently applied paints.

H. Aluminum Substrates: Remove loose surface oxidation. I. Wood Substrates: 1. Scrape and clean knots, and apply coat of knot sealer before applying primer. 2. Sand surfaces that will be exposed to view, and dust off.

3. Prime edges, ends, faces, undersides, and backsides of wood.

4. After priming, fill holes and imperfections in the finish surfaces with putty or plastic wood filler. Sand smooth when dried. J. Cotton or Canvas Insulation Covering Substrates: Remove dust, dirt, and other foreign material that might impair bond of paints to substrates. 3.3 APPLICATION

1. Use applicators and techniques suited for paint and substrate indicated. 2. Paint surfaces behind movable equipment and furniture same as similar exposed surfaces. Before final installation, paint surfaces behind permanently fixed equipment or furniture with prime coat only.
